Architectures and Design Automation Tools for Application-Level Network Security Sascha Mühlbach,2015-04-30 The relevance of the Internet has dramatically grown in the past decades However the enormous financial impact attracts many types of criminals Setting up proper security mechanisms e g Intrusion Detection Systems IDS has therefore never been more important than today To further compete with today s data transfer rates 10 to 100 Gbit s dedicated hardware accelerators have been proposed to offload compute intensive tasks from general purpose processors As one key technology reconfigurable hardware architectures e g the Field Programmable Gate Array FPGA are of particular interest to this end This work addresses the use of such FPGAs in the context of interactive communication applications which goes beyond the regular packet level operations often seen in this area To support rapid prototyping a novel FPGA platform NetStage has been designed and developed which provides a communication core for Internet communication and a flexible connection bus for attaching custom applications modules A hardware honeypot the MalCoBox has been set up as a proof of concept application Furthermore to address the ongoing issue of hardware programming complexity the domain specific Malacoda

language for abstractly formulating honeypot packet communication dialogs is presented and discussed. An associated compiler translates Malacoda into high performance hardware modules for NetStage. Together NetStage and Malacoda address some of the productivity deficiencies often recognized as major hindrances for the more widespread use of reconfigurable computing in communications applications. Finally the NetStage platform has been evaluated in a real production environment.
