Hogan, 2021-04-27 A richly detailed history that uncovers the challenges and limitations of our increasing reliance on genetic data in medical decision making Shobita Parthasarathy author of Building Genetic Medicine Medical geneticists began mapping the chromosomal infrastructure piece by piece in the 1970s by focusing on what was known about individual genetic disorders Five decades later their infrastructure had become an edifice for prevention allowing expectant parents to test prenatally for hundreds of disease specific mutations using powerful genetic testing platforms In this book Andrew J Hogan explores how various diseases were made genetic after 1960 with the long term aim of treating and curing them using gene therapy In the process he explains these disorders were located in the human genome and became targets for prenatal prevention while the ongoing promise of gene therapy remained on the distant horizon In narrating the history of research that contributed to diagnostic genetic medicine Hogan describes the expanding scope of prenatal diagnosis and prevention He draws on case studies of Prader Willi fragile X DiGeorge and velo cardio facial syndromes to illustrate that almost all testing in medical genetics is inseparable from the larger and increasingly big data oriented aims of biomedical research Hogan also reveals how contemporary genetic testing infrastructure reflects an intense collaboration among cytogeneticists molecular biologists and doctors specializing in human malformation Hogan critiques the modern ideology of genetic prevention which suggests all pregnancies are at risk for genetic disease and should be subject to extensive genomic screening He examines the dilemmas and ethics of the use of prenatal diagnostic information in an era when medical geneticists and biotechnology companies offer whole genome prenatal screening essentially searching for any disease causing mutation Hogan s analysis is animated
