Biosilica in Evolution, Morphogenesis, and Nanobiotechnology Werner E. G. Müller, Mikhael A. Grachev, 2009-02-07 Lake Baikal is the oldest deepest and most voluminous lake on Earth comprising one fifth of the World's unfrozen fresh water It hosts the highest number of endemic animals recorded in any freshwater lake Until recently it remained enigmatic why such a high diversity evolved in the isolated Lake Baikal Focusing on the sponges phylum Porifera as an example some answers are provided to fundamental questions on evolutionary forces The characteristic feature of

these animals is that they form their polymeric silicic acid skeleton enzymatically This process is explored using modern molecular biological and cellular biological techniques to outline strategies to fabricate novel materials applicable in biomedicine and nanooptics

compared to Earth microgravity galactic cosmic radiation solar UV radiation space vacuum thermal extremes that microbes are exposed to but how they adapt and respond is still poorly understood Studies to date though have shown that these responses can range from being beneficial for human exploration to negatively impact long duration missions Hence investigating the reaction of microorganisms to space conditions the alterations in their physiology and virulence not only helps shed light on the molecular basis of tolerance but has implications for both space exploration and astrobiological missions
