Why do they occur in certain areas and not in others? How can we, within reason, protect ourselves from their devastation? And how far have we come and how far can we go in predicting when they will strike? For the reader who wants a concise and accessible guide to what makes the ground shake and explode, this is the perfect introduction.

Plate Tectonics Julia J. Quinlan, 2017-12-15

The ground beneath our feet feels sturdy and still, but Earth is actually covered in moving plates. These large plates make up the outer layer of Earth's surface and sit on top of another layer made up of molten rock. Borders between two plates are often the site of earthquakes and volcanoes. The plates can slide against each other, crash into each other, move apart, and even create mountains. There is so much to learn about what's going on beneath the surface as is provided here for your readers, perfectly encapsulated.
