

The injection nozzles are of the hole type and the throttle type.

The fuel delivered from the injection pump enters the nozzle holder. When reaching the specified pressure value, the fuel overcomes the spring force to push up the needle valve of the nozzle tip, spraying from the injection orifice at the end of the nozzle into cylinder (hole type) or swirl chamber (throttle type).

The injection pressure can be adjusted by increasing or decreasing the number of washers in the spring.

(9) Fuel Filter

The fuel filter is of the spin-on type designed for ease of element replacement. The element is made integral with the outer casing, the center of the casing is being threaded.

(10) Water Separator <Option>

The sedimenter type water separator separates gas oil and water centrifugally by taking advantage of their difference in specific gravity.

The fuel that has flowed in from the inlet connector is squeezed by the fuel path of the head to increase the flow velocity and spins. The separated water is sedimented in the case, whereas the water-separated fuel is drawn through the fuel path in the center of the head into the feed pump.

The water separator sediments not only water but also mud components.

A red water level goes up and down with the water level in the semitransparent case, making it possible to visually check the water quantity.
