OPERATION

The clutch pedal assembly is connected by an adjustable rod, 1, to a clevis, 2, and cross shaft assembly, 3, on which a fork, 4, is mounted.

Depressing the clutch pedal causes the cross shaft, 3, and fork, 4, to move the release bearing, 5, forward and depress the pressure plate release levers. This action draws the pressure plate, 6, away from the clutch disc, 7, releasing the disc from contact with the flywheel.

The friction drive from the engine is then disconnected to enable gear changes to take place.

After a gear change is made and the clutch pedal is released, the release bearing and hub are returned to the free position by a spring, 9, attached to a hanger, 10.

The main springs of the pressure plate assembly, 6, then reassert pressure on the plate moving it forward to press the clutch disc, 7, into contact with the flywheel and establish the drive to the transmission.

The release bearing, 5, is pre-lubricated and never requires lubrication. The pressure plate assembly, 6, is not repairable and must be replaced as a complete assembly if service is required.
