Sharing the Costs and Benefits of Energy and Resource Activity Lila Barrera-Hernández, Barry Barton, Lee Godden, Alastair Lucas, Anita Rønne, 2016-03-31 A new phase is emerging in the relationship between energy and resource activities and the communities that are affected by them Any energy or resource project a mine a wind farm a dam for hydroelectricity or a shale gas development will involve a mix of impacts and benefits for communities For many years the

law has mediated impacts on communities and provided for the distribution of financial benefits Now there is growing awareness of the need to consider not only a wider range of costs and benefits for communities from energy and resource projects but also the effects on communities at multiple scales and in complex ways Sharing the costs and benefits of natural resource activity has now become a legal requirement for energy and resource projects operating in many jurisdictions particularly in developing countries This book uses cases studies from across the globe to examine the emergence of such legal measures their advantages and disadvantages and the improvements that may be feasible in the legal frameworks used to distribute the costs and benefits of energy and resources activity The book has three parts Part I considers general legal and conceptual frameworks Part II addresses the mechanisms available to distribute costs and benefits and Part III considers the role of public engagement and participation in the sharing of the costs and benefits from energy and resource projects

Understanding the Energy Transition Natalia Magnani,Giovanni Carrosio,2021-11-22 The transformation of the dominant model of centralized energy production from fossil fuels to renewable energies is at the center of the public and scientific debate as well as the subject of national and European policies as it is connected to highly topical issues such as climate change emissions reduction and natural disasters security of supply and sustainability of the current economic development model Up to now this topic has been mainly addressed by the economic and engineering sciences with a research focus on the hardware rather than on the human and social software However energy systems and the possibilities of change are not only economic or technological but involve also patterns of social life representations organizational models and relational structures In order to generate the social preconditions for the transition to a low emission society focused on a growing production of energy from renewable sources and on a greater sustainability of consumption it is therefore urgent to reaffirm the centrality of a sociological approach to energy This book focused on three core research areas which are crucial to understand what is at stake with the energy transition conflicts over the construction and location of renewable energy production plants collective action on renewable sources that promote a new model of energy system in which consumers are also producers and the social territorial impact of energy policies Management of Civic Energy and the Green Transformation Anna Brzozowska,Piotr Maśloch,Grzegorz Maśloch,2023-05-11 An increase in the global demand for energy combined with an increase in the price of energy and energy products has advanced the growing interest in renewable energy technologies and the wide implementation of renewable energy sources RES Member States of the European Union have been global leaders in the use of renewable energy and in the transition to new technologies Management of Civic Energy and the Green Transformation A Case Study of Poland examines the current issues of transitioning from traditional energy sources to newer renewable energy sources while balancing supplies and working synergistically with existing conventional sources Features Offers a balanced blend of theory and practice of development economics for renewable energy implementation Presents a case study of how Poland is working towards their energy

transition and provides other examples and recent statistical data from other European Union countries. Analyses the legal and systemic conditions supporting the development of renewable energy systems and offers direction on the potential for the green development of the civic energy sector. Fairness and Justice in Environmental Decision Making Catherine Gross, 2014-01-10. By crossing disciplinary boundaries this book uniquely connects theories of justice with people's lived experience within social conflicts over resource sharing. It shows why some conflicts such as local opposition to wind farms and water disputes have become intractable social problems in many countries of the world. It shows the power of injustice in generating opposition to decisions. The book answers the question why are the results of many government initiatives and policies not accepted by those affected. Focusing on two social conflicts over water sharing in Australia to show why fairness and justice are important in decision making the book shows how these conflicts are typical of water sharing and other natural resource conflicts experienced in many countries around the world particularly in the context of climate change. It tells the stories of these conflicts from the perspectives of those involved. These practically based findings are then related back to ideas and constructs of justice from disciplines such as social psychology, political philosophy and jurisprudence. With a strong practical focus this book offers readers an opportunity to develop a deep understanding of fairness and justice in environmental decision making. It opens up a wealth of fairness and justice ideas for decision makers, practitioners and researchers in natural resource management, environmental governance, community consultation and sustainable development as well as people in government and corporations who interface and consult with communities where natural resources are being used. Use of Earth Observations for Actionable Decision Making in the Developing World Niall Patrick Hanan, Ashutosh S. Limaye, Daniel Eric Irwin, 2021-01-13. *Energy Transition in East Asia* Kuei-Tien Chou, 2017-12-01. The Fukushima disaster of 2011 shook the globe arousing warm debate and new research within the academic fields of countries in both the West and the East on issues related to nuclear security, public trust, government governance, risk governance and risk perception along with technological and social aspects. The Fukushima incident not only revealed the importance of risk governance in the East Asian region but also became an important turning point in the restructuring of energy in several East Asian nations. However, the regulatory culture in East Asian countries is by nature different to that of their western counterparts. The history and culture of East Asia has formed East Asian countries' unique regulatory characteristics. This book aims to establish a risk governance structure for the East Asian region providing a completely new perspective for both practical implementation and the academic field. It focusses on the problems of risk governance in East Asia. Through a discussion of the risk-related issues raised by contemporary globalization this book outlines the unique form of East Asia's risk governance architecture. It brings together the work of top academics from Japan, South Korea and Taiwan to provide a common picture of how these three countries' governments are dealing with the energy transition brought on by the climate change crisis. The various aspects of East Asia's unique regulatory culture and

governance models are placed into context while East Asia's risk governance theoretical framework is outlined **The Oxford Handbook of Energy and Society** Dr. Debra J.
