

TERMS AND DEFINITIONS

MECHANICS: NEWTON'S LAWS	
Acceleration	The rate of change of velocity.
Free-body diagrams	This is a diagram that shows the relative magnitudes and directions of forces acting on a body/particle that has been isolated from its surroundings.
Kinetic frictional force (f_k)	The force acting parallel to a surface and opposes the motion of a MOVING object relative to the surface.
Mass	The amount of matter in a body measured in kilogram (kg).
Maximum static frictional force (f_s^{max})	The static frictional force is a maximum (f_s^{max}) just before the object starts to move across the surface.
Newton's first law of motion	A body will remain in its state of rest or motion at constant velocity unless a non-zero resultant/net force acts on it.
Inertia	The resistance of a body to a change in its state of rest or uniform motion in a straight line. Mass is a measure of an object's inertia.
Newton's second law of motion	When a resultant/net force acts on an object, the object will accelerate in the direction of the force at an acceleration directly proportional to the force and inversely proportional to the mass of the object. In symbols: $F_{\text{net}} = ma$
Newton's third law of motion	When object A exerts a force on object B, object B SIMULTANEOUSLY exerts a force equal in magnitude but opposite in direction on object A.
Newton's law of universal gravitation	Each body in the universe attracts every other body with a force that is directly proportional to the product of their masses and inversely proportional to the square of the distance between their centres. In symbols: $F = \frac{Gm_1m_2}{r^2}$
Normal force	The force or the component of a force which a surface exerts on an object with which it is in contact, and which is perpendicular to the surface.
Static frictional force (f_s)	The force acting parallel to a surface and opposes the tendency of motion of a STATIONARY object relative to the surface.
Weight	The gravitational force, in newton (N), exerted on an object.
Weightlessness	The sensation experienced when all contact forces are removed i.e. no external objects touch one's body.

MECHANICS: MOMENTUM AND IMPULSE	
Contact forces	Contact forces arise from the physical contact between two objects (e.g. a soccer player kicking a ball.)
Non-contact forces	Non-contact forces arise even if two objects do not touch each other (e.g. the force of attraction of the earth on a parachutist even when the earth is not in direct contact with the parachutist.)
Momentum	Linear momentum is the product of an object's mass and its velocity. In symbols: $p = mv$ Unit: N·s or kg·m·s ⁻¹
Newton's Second Law of motion in terms of momentum	The net (or resultant) force acting on an object is equal to the rate of change of momentum of the object in the direction of the net force. In symbols: $F_{\text{net}} = \frac{\Delta p}{\Delta t}$
Principle of conservation of linear momentum	The total linear momentum in an isolated system remains constant (is conserved). In symbols: $\Sigma p_{\text{before}} = \Sigma p_{\text{after}}$
Closed system	A system in which the net external force acting on the system is zero.
Impulse	The product of the resultant/net force acting on an object and the time the resultant/net force acts on the object. In symbols: Impulse = $F_{\text{net}}\Delta t$ Unit: N·s or kg·m·s ⁻¹
Impulse-momentum theorem	In symbols: $F_{\text{net}}\Delta t = m\Delta v = m(v_f - v_i)$ Unit: N·s or kg·m·s ⁻¹
Elastic collision	A collision in which both total momentum and total kinetic energy are conserved.
Inelastic collision	A collision during which kinetic energy is not conserved.

Psychoanalytical neuroscience: Exploring psychoanalytic concepts with neuroscientific methods Nikolai Axmacher, Henrik Kessler, Gerd Thomas Waldhauser, 2015-01-09 Sigmund Freud was a trained neuroanatomist and wrote his first psychoanalytical theory in neuroscientific terms Throughout his life he maintained the belief that at some distant day in the future all psychoanalytic processes could be tied to a neural basis We must recollect that all of our provisional ideas in psychology will presumably one day be based on an organic substructure Freud 1914 On Narcissism An Introduction Fundamental Freudian concepts reveal their foundation in the physiological science of his time most importantly among them the concept of libidinous energy and the homeostatic principle of constancy However the subsequent history of psychoanalysis and neuroscience was mainly characterized by mutual ignorance or even opposition many scientists accused psychoanalytic viewpoints not to be scientifically testable and many psychoanalysts claimed that their theories did not need empirical support outside of the therapeutic situation On this historical background it may appear surprising that the recent years have seen an increasing interest in re connecting psychoanalysis and neuroscience in various ways By studying psychodynamic consequences of brain lesions in neurological patients by investigating how psychoanalytic therapy affects brain structure and function or even by operationalizing psychoanalytic concepts in well controlled experiments and exploring their neural correlates These empirical studies are accompanied by theoretical work on the philosophical status of the neuropsychanalytic endeavour In this volume we attempt to provide a state of the art overview of this new exciting field All types of submissions are welcome including research in patient populations healthy human participants and animals review articles on some empirical or theoretical aspect and of course also critical accounts of the new field Despite this welcome variability we would like to suggest that all contributions attempt to address one or both of two main questions which should motivate the connection between psychoanalysis and neuroscience and that in our opinion still remain exigent First from the neuroscientific side why should researchers in the neurosciences address psychoanalytic ideas and what is or will be the impact of this connection on current neuroscientific theories Second from the psychoanalytic side why should psychoanalysts care about neuroscientific studies and how can current psychoanalytical theory and practice benefit from

their results Of course contributors are free to provide a critical viewpoint on these two questions as well
