phase earth fault occurs close to the generator neutral the driving voltage will be low and hence the value of fault current will also be extremely less For faults in the last 5% of the winding from star point the earth fault current is too low that it cannot be detected by protective relay and hence it is very difficult to detect stator earth fault through current based protection Therefore single phase earth fault of stator winding can be protected by using voltage based protections either using Residual over voltage or Neutral voltage displacement protection function There are different philosophies used for detecting earth fault in stator winding In this paper we are showing earth fault setting calculation and its interlock
