## Assessing a novel room-temperature RNA storage medium for compatibility in microarray gene expression analysis

**Keywords:** RNA storage; anhydrobiosis; room temperature

RNA integrity is a critical factor in obtaining meaningful gene expression data. Current methodologies rely on maintaining samples in cold environments during collection, transport, processing, and storage procedures, which are also extremely time-sensitive. Several RNA storage products are commercially available to help prevent degradation during the handling and storage steps; however, samples must be kept cold for optimal protection. We have evaluated a novel RNA storage medium based on anhydrobiosis for stabilizing and protecting samples from degradation at room temperature that are intended for use in microarray analysis. Samples were stored dry at room temperature for various time periods to assess any degradation or loss of activity as compared with frozen control samples. Recovered samples were used directly for analysis without further purification and exhibited no interference or inhibition in downstream applications. Comparison of gene expression profiles indicate no significant differences between freezer-stored control samples and those kept at room temperature protected in the RNA storage medium. The quality of recovered RNA was confirmed using spectrophotometry and Bioanalyzer analysis and was identical to control samples. The ability to stabilize RNA samples at ambient temperatures for extended time periods will have tremendous use, particularly for sample shipment to core facilities.

samples are handled minimally and kept cold at all times unless otherwise directed. Samples are typically stored frozen ( $-20^{\circ}\text{C}$ ,  $-80^{\circ}\text{C}$ , or under liquid nitrogen) in RNase-free solutions (e.g., DEPC-treated water, TE buffer or other commercially available RNA storage solutions) and thawed on ice only when needed. Multiple freeze-thaw cycles and prolonged exposure to increased temperatures are avoided as these conditions serve to promote degradation of precious and labile RNA samples. Despite all the precautions taken to maintain what is typically referred to as cold-chain logistics, the integrity of a sample is often compromised using current cold storage methodologies, particularly during long-term storage or sample transport, where shipment delays and suboptimal packaging are a common occurrence. There is a critical need for technologies providing simple room-temperature storage of biological samples that do not require cold chain logistics or complicated sample recovery protocols.

A novel storage medium designed specifically to preserve and protect purified total RNA samples stored dry at room temperatures is commercially available. RNAsable (Biomatrix, San Diego, CA, USA) is a synthetic matrix that was developed based on the principle of anhydrobiosis, a biological mechanism employed by some multicellular organisms that enables their survival while dry for >100 years (4). The matrix forms a thermostable barrier around RNA during the drying process to protect samples from degradation during storage at ambient temperatures. Samples are ready for immediate analysis following a single rehydration step, eliminating the need for further downstream purification. We have evaluated the use of RNAsable for storage of purified total RNA
