Guide to Reliable Internet Services and Applications Charles R.

Kalmanek, Sudip Misra, Yang (Richard) Yang, 2010-06-09 An oft repeated adage among telecommunication providers goes There are ve things that matter reliability reliability reliability time to market and cost If you can t do all ve at least do the rst three Yet designing and operating reliable networks and services is a Herculean task Building truly reliable components is unacceptably expensive forcing us to c struct reliable systems out of unreliable components The resulting systems are inherently complex consisting of many different kinds of components running a variety of different protocols that interact in subtle ways Inter networkssuch as the Internet span multiple regions of administrative control from campus and cor rate networks to Internet Service Providers making good end to end performance a shared responsibility borne by sometimes uncooperative parties Moreover these networks consist not only of routers but also lower layer devices such as optical switches and higher layer components such as rewalls and proxies And these components are highly con gurable leaving ample room for operator error and buggy software As if that were not dif cult enough end users understandably care about the performance of their higher level applications which has a complicated relationship with the behavior of the underlying network Despite these challenges researchers and practitioners alike have made trem dous strides in improving the reliability of modern networks and services

Information Assurance Joseph Boyce, Daniel Jennings, 2002-06-25 Written

by two INFOSEC experts this book provides a systematic and practical approach for establishing managing and operating a comprehensive Information Assurance program It is designed to provide ISSO managers security managers and INFOSEC professionals with an understanding of the essential issues required to develop and apply a targeted information security posture to both public and private corporations and government run agencies There is a growing concern among all

corporations and within the security industry to come up with new approaches to measure an organization's information security risks and posture. Information Assurance explains and defines the theories and processes that will help a company protect its proprietary information including:

- The need to assess the current level of risk
- The need to determine what can impact the risk
- The need to determine how risk can be reduced

The authors lay out a detailed strategy for defining information security, establishing IA goals, providing training for security awareness, and conducting airtight incident response to system compromise. Such topics as defense in depth, configuration management, IA legal issues, and the importance of establishing an IT baseline are covered in depth from an organizational and managerial decision-making perspective. Experience-based theory is provided in a logical and comprehensive manner. Management-focused coverage includes establishing an IT security posture, implementing organizational awareness, and training, and understanding the dynamics of new technologies. Numerous real-world examples provide a baseline for assessment and comparison.

Collaborative Networks for a Sustainable World Luis M. Camarinha-Matos, Xavier Boucher, Hamideh Afsarmanesh, 2010-09-21

Collaborative Networks for a Sustainable World: Aiming to reach a sustainable world calls for a wider collaboration among multiple stakeholders from different origins as the changes needed for sustainability exceed the capacity and capability of any individual actor. In recent years, there has been a growing awareness both in the political sphere and in civil society, including the business sectors, on the importance of sustainability. Therefore, this is an important and timely research issue, not only in terms of systems design but also as an effort to borrow and integrate contributions from different disciplines when designing and organizing those systems. The discipline of collaborative networks, especially which has already emerged in many application sectors, shall play a key role in the implementation of effective sustainability strategies. PROVE 2010 focused on sharing knowledge and experiences as well as identifying directions for further research and development in this area. The conference discussed models, infrastructures, support tools, and governance principles developed for collaborative networks as important resources to support multi-stakeholder sustainable developments. Furthermore, the challenges of this theme open new research directions for CNs.
