The parts of the neuron have been labeled. Your challenge is to write the correct name for each part and explain what it does. If you need some help, ask your tutor or consult the lecture notes/Google.

1. Axon terminals

Release the neurotransmitters/
information of the presynaptic cell

2. Myelin Sheath – nodes

Allows electrical impulses to be
transmitted quickly and efficiently
along the nerve cells

3. Axon

Carries impulses/ information away
from the nerve/ cell body

4. Soma (Cell body)

Contain genetic information,
maintains the structure of the
neuron and provides energy to drive
activities

5. Nucleus

Needed for the production of
proteins within the cell

6. Dendrites

Receiving part of the neuron.
Receives synaptic input from the
axons – receives information from
other cells.

Glial = Neuronal Signaling Glenn I. Hatton, Vladimir Parpura, 2004-05-31 *Glial Neuronal Signaling* fills a need for a monograph textbook to be used in advanced courses or graduate seminars aimed at exploring glial neuronal interactions Even experts in the field will find useful the authoritative summaries of evidence on ion channels and transporters in glia genes involved in signaling during development metabolic cross talk and cooperation between astrocytes and neurons to mention but a few of the timely summaries of a wide range of glial neuronal interactions The chapters are written by the top researchers in the field of glial neuronal signaling and cover the most current advances in this field The book will also be of value to the workers in the field of cell biology in general When we think about the brain we usually think about neurons Although there are 100 billion neurons in mammalian brain these cells do not constitute a majority Quite the contrary glial cells and other non neuronal cells are 10 50 times more numerous than neurons This book is meant to integrate the emerging body of information that has been accumulating revealing the interactive nature of the brain

The Functional Anatomy of the Reticular Formation

Ugo Faraguna, Michela Ferrucci, Filippo S. Giorgi, Francesco Fornai, 2019-10-04 The brainstem reticular formation is the archaic core of ascending and descending pathways connecting the brain with spinal cord After the pioneer description of the activating role of the ascending reticular activating system by Moruzzi and Magoun in 1949 an increasing number of studies have contributed to disclose the multifaceted roles of this brain area In fact the brainstem reticular formation sub serves a variety of brain activities such as the modulation of the sleep waking cycle the level of arousal and attention the drive for novelty seeking behaviors and mood Meanwhile descending pathways play a key role in posture modulation extrapyramidal movements and autonomic functions such as breathing and blood pressure Moreover both descending and ascending fibers of the reticular formation are critical in gating the sensory inputs and play a critical role in pain modulation and gaze control All these activities are impaired when a damage affects critical nuclei of the reticular formation Remarkably in

neurodegenerative diseases involving reticular nuclei the rich collaterals interconnecting reticular isodendritic neurons represent a gateway for disease spreading placing the role of the reticular nuclei as a pivot in a variety of brain disorders The present Research Topic is an updated collection of recent studies which contribute to define the systematic anatomy of the reticular formation its physiological and pharmacological features as well as its involvement in neurodegenerative disorders and neuroprotection
