*Self-Directed Learning* Elsa Mentz,Dorothy Laubscher,Jako Olivier,2021-12-31 This book on self directed learning SDL is devoted to original academic scholarship within the field of education and is the 6th volume in the North West University NWU SDL book series In this book the authors explore how self directed learning can be considered an imperative for education in a complex modern society Although each chapter represents independent research in the field of self directed learning the chapters form a coherent contribution concerning the scholarship of self directed learning and specifically the effect of environmental and praxis contexts on the enhancement of self directed learning in a complex society The publication as a whole provides diverse perspectives on the importance of self directed learning in varied contexts Scholars working in a wide range of fields are drawn together in this scholarly work to present a comprehensive dialogue regarding self directed learning and how this concept functions in a complex and dynamic higher education context This book presents a combination of theory and practice which reflects selected conceptual dimensions of self directed learning in society as well as research based findings pertaining to current topical issues relating to implementing self directed learning in the modern world The varied methodologies provide the reader with different and balanced perspectives as well as varied and innovative ideas on how to conduct research in the field of self directed learning     Agent-Based and Individual-Based Modeling Steven

F. Railsback,Volker Grimm,2025-06-03 The essential textbook on agent based modeling now fully updated and expanded Agent Based and Individual Based Modeling has become the standard textbook on the subject for classroom use and self instruction Drawing on the latest version of NetLogo and fully updated with new examples exercises and an enhanced text for easier comprehension this is the essential resource for anyone seeking to understand how the dynamics of biological social and other complex systems arise from the characteristics of the agents that make up these systems Steven Railsback and Volker Grimm lead students stepwise through the processes of designing programming documenting and doing scientific research with agent based models focusing on the adaptive behaviors that make these models necessary They cover the fundamentals of modeling and model analysis introduce key modeling concepts and demonstrate how to implement them using NetLogo They also address pattern oriented modeling an invaluable strategy for modeling real world problems and developing theory This accessible and authoritative book focuses on modeling as a tool for understanding real complex systems It explains how to pose a specific question use observations from actual systems to design models write and test software and more A hands on introduction that guides students from conceptual design to computer implementation to analysis Filled with new examples and exercises and compatible with the latest version of NetLogo Ideal for students and researchers across the natural and social sciences Written by two leading practitioners Supported by extensive instructional materials at [www.railsback.grimm.abm.book.com](http://www.railsback.grimm.abm.book.com)     **Using Complexity Theory for Research and Program Evaluation**

Michael Wolf-Branigin,2013-01-22 Complexity as a paradigm has been underutilized by social work but this cutting edge

pocket guide makes a convincing argument for its use Every agency worker has been faced with a deluge of records making it difficult to grasp onto structures and trends undergirding behavior Complexity theory studies the interactions of competitive and cooperative tendencies of agents such as individuals families groups or communities making the case that there is a hidden order in things that are seemingly chaotic Exploring their interactions involves identifying a set of simple rules that the agents follow revealing patterns that emerge without a predetermined template Readers will learn how to frame their research using the components found in complex systems by using their existing knowledge of research methods and applying basic mathematical concepts Concepts such as bordering between chaos and equilibrium diverse perspectives diverse heuristics robustness and wisdom of crowds are considered and applied to social work research studies Basic introductions on game theory graph theory Boolean logic decision theory and network science provide the necessary mathematical background for understanding interconnectedness and networking The next part of the book is a hands on guide to the agent based modeling software NetLogo By inputting initial parameters and rules the outputted models provide valuable information for visualizing unintended consequences including how conflict can foster cooperation and how threats to a social network can improve the network s robustness and resiliency The result is both a user friendly introduction to using complexity theory in a socio environmental context and a framework that provides an overarching structure for investigating process outcomes and the collective behavior of groups

**Artificial Intelligence - Agents and Environments , Rethinking Environmental Justice in Sustainable Cities** Heather E. Campbell,Yushim Kim,Adam M. Eckerd,2015-05-15 As the study of environmental policy and justice becomes increasingly significant in today s global climate standard statistical approaches to gathering data have become less helpful at generating new insights and possibilities None of the conventional frameworks easily allow for the empirical modeling of the interactions of all the actors involved or for the emergence of outcomes unintended by the actors The existing frameworks account for the what but not for the why Heather E Campbell Yushim Kim and Adam Eckerd bring an innovative perspective to environmental justice research Their approach adjusts the narrower questions often asked in the study of environmental justice expanding to broader investigations of how and why environmental inequities occur Using agent based modeling ABM they study the interactions and interdependencies among different agents such as firms residents and government institutions Through simulation the authors test underlying assumptions in environmental justice and discover ways to modify existing theories to better explain why environmental injustice occurs Furthermore they use ABM to generate empirically testable hypotheses which they employ to check if their simulated findings are supported in the real world using real data The pioneering research on environmental justice in this text will have effects on the field of environmental policy as a whole For social science and policy researchers this book explores how to employ new and experimental methods of inquiry on challenging social problems and for the field of environmental justice the authors demonstrate how ABM helps illuminate the complex social and policy interactions that lead

to both environmental justice and injustice      *Finding the Limits of the Limes* Philip Verhagen, Jamie Joyce, Mark R. Groenhuijzen, 2019-02-08 This open access book demonstrates the application of simulation modelling and network analysis techniques in the field of Roman studies It summarizes and discusses the results of a 5 year research project carried out by the editors that aimed to apply spatial dynamical modelling to reconstruct and understand the socio economic development of the Dutch part of the Roman frontier limes zone in particular the agrarian economy and the related development of settlement patterns and transport networks in the area The project papers are accompanied by invited chapters presenting case studies and reflections from other parts of the Roman Empire focusing on the themes of subsistence economy demography transport and mobility and socio economic networks in the Roman period The book shows the added value of state of the art computer modelling techniques and bridges computational and conventional approaches Topics that will be of particular interest to archaeologists are the question of forced surplus production the demographic and economic effects of the Roman occupation on the local population and the structuring of transport networks and settlement patterns For modellers issues of sensitivity analysis and validation of modelling results are specifically addressed This book will appeal to students and researchers working in the computational humanities and social sciences in particular archaeology and ancient history      *Modeling and Simulation in the Systems Engineering Life Cycle* Margaret L. Loper, 2015-04-30 This easy to read text provides a broad introduction to the fundamental concepts of modeling and simulation M presents contributions from specialists in each topic covered introduces the foundational elements and processes that serve as the groundwork for understanding M explores common methods and methodologies used in M discusses how best to design and execute experiments covering the use of Monte Carlo techniques surrogate modeling and distributed simulation explores the use of M provides a selection of case studies illustrating the use of M S in systems engineering across a variety of domains      **Urban Analytics** Alex D.
