Experimental Neuropsychology Gianfranco Denes, Luigi Pizzamiglio, 2020-03-06 The domain of neuroscience has had one of the most explosive growths in recent decades within this development there has been a remarkable and renewed interest in the study of the relations between behaviour and the central nervous system Part of this new attention is connected with the contribution of new technologies PET fMRI permitting more precise mapping of neural structures responsible for cognitive functions and the development of new theoretical models of mental activities The diffusion of new pathologies for example the pattern of cognitive impairment associated with AIDS has further enlarged the field of clinical neuropsychology Finally there has been an expanding clinical interest in the understanding and management of age related cognitive changes This volume is the translated and updated version of the second edition of Manuale di Neuropsicologia Zanichelli 1996 by the same authors and it reflects the current status of the art It is intended to blend clinical and theoretical aspects of neuropsychology The first part discusses the instrumental and clinical methods of investigation in neuropsychology together with their development A long section is dedicated to the language and memory disorders The impairment of non verbal cognitve functions such as the disorders of space orientation of of visuo perceptive abilities and of the emotions and attention are extensively discussed The pattern of degenerative dementias is thoroughly described as e is thoroughly described as well as a number of new topics such as a neuropsychological approach to consciousness Finally perspectives for treatment of some cognitive disorders are outlined **Neurobehavior of Language and Cognition** Martin L. Dementias S. Govoni, C.L. Bolis, M. Trabucchi, 2012-12-06 To a certain extent the dementias have been forgotten diseases until just recently when they were brought to the attention of the general public and health authorities as a result of the increasing number of cases in the aging population especially among famous people and because of the efforts of private foundations The goals of the present volume are to present the dementias to health practitioners to provide some basic information on their epidemiology and biological basis and to discuss the diagnostic and clinical problems that physicians and institutions face when caring for demented patients This book explores the various types of dementias and is not limited to Alzheimer's disease although as expected more information is available and presented on this pathology On the other hand a few fundamental questions on dementia can only be answered through a comparison of the various forms Examples of such questions are the following Is the loss of cerebral tissue sufficient to cause dementia Are there thresholds or is there a continuous progression toward the irreversible development of dementia Are there common pathways in the dementing process Are there common risk factors Comparative analysis allows the common and distinctive patterns of the various dementias to be defined ultimately leading to more focused therapeutic interventions Clinical Neuropsychology and Cost

Neuroimaging in child neuropsychiatric disorders B. Garreau, 2012-12-06 The twentieth century was the century of the development of morphological cerebral imaging by tomodensitometry TDM and Magnetic Resonance Imaging MRI. In recent years, new brain imaging methods were used in adults with neurological lesions and more recently in adults with psychiatric disorders. Now it is also possible to use most of these morphological and functional brain imaging methods in children. This book presents the main morphological and functional brain imaging methods that we can use in the child. Two main applications are developed: physiopathological and therapeutical interest. The physiopathological approach is of a great interest coupled with clinical evaluation in psychomotor disorders like hyperkinetic or Tourette syndrome and in developmental disorders like autistic syndrome, mental retardation, Rett Syndrome.

The Assessment, Evaluation and Rehabilitation of Everyday Memory Problems Barbara A. Wilson, 2013-11-07 In the World Library of Psychologists series, international experts present career-long collections of what they judge to be their finest work: extracts from books, key articles, salient research findings, and their major theoretical and practical contributions. This volume of self-selected papers recognises Professor Barbara A. Wilson's major contribution to the study of neuropsychology. Published over a 25-year period, the papers included here address the assessment, treatment, and evaluation of rehabilitation provided to people who have memory difficulties arising from an injury or illness affecting the brain. This selection of papers includes work on errorless learning, the natural history of the development of compensatory memory systems, paging systems developed to enhance independent daily living for memory-impaired people, and single case experimental designs to appraise the response of individual patients. The final section includes a practical framework for understanding compensatory behaviour, a model of cognitive rehabilitation, and a discussion of the dilemmas created by the different aims of neuroscience as opposed to those of clinicians. This book will be of great interest to clinical psychologists, neuropsychologists, occupational therapists, and speech and language therapists, along with anyone who is interested in reducing the impact of memory problems on people who have suffered brain injury.
