7.2 Angles

An angle is formed when two rays have a common endpoint called a vertex.

Angles can be named by its vertex or by a point from each ray and the vertex in the middle.

The vertex of the angle on the right is _____.

The angle on the right has two sides: _____.

The figure on the right may be named:

- $\angle B$, $\angle ABC$ or $\angle CBA$
- In every case, B is the focus of the name – since B is the _____ of the angle!

A protractor is a device used to measure or draw an angle.

Error Alert!

A common measuring error with a protractor occurs because most protractors have 2 rows of numbers and you must choose the correct measurement. The following steps can be used to never make this error when measuring or drawing angles.

1. **Classify the angle first!**
 - If you classify the angle before you measure or draw it, you will know which row of numbers you need to use on your protractor.
2. Place the center (or hole) of the protractor on the vertex of the angle.
3. Line up the bottom guideline along either of the sides of the angle and follow the remaining side to the correct number.

Angles are classified as acute, right, obtuse or straight.

Acute angles measure less than 90° .

Right angles measure exactly 90° .

Obtuse angles measure more than 90° .

Straight angles measure 180° and form a line.
