Logics and Models of Concurrent Systems Krzysztof R. Apt, 2013-03-08 The cooperation test Apt Francez de Roeper was originally conceived to capture the proof theoretical analogue of distributed message exchange between disjoint processes as opposed to the interference freedom test Owicki Gries being the proof theoretical analogue of concurrent communication by means of interference through jointly shared variables Some authors Levin Gries Lamport Schneider Schlichting and Schneider stress that both forms of communication can be proof theoretically characterized using interference freedom only since proofs for both ultimately amount to an invariance proof of a big global assertion Ashcroft invariance of whose parts amounts to interference freedom Yet I feel that the characteristic nature of the cooperation test is still preserved in the analysis of these authors because in their analysis of CSP the part dealing with interference freedom specializes to maintenance of a global invariant the expression of which requires per process the introduction of auxiliary variables which are updated in that process only thus preserving the concept of disjointness as opposed to sharing since now all variables from different processes are disjoint The cooperation test has been applied to characterize concurrent communication as occurring in Hoare's Communicating Sequential Processes CSP Hoare 2 Ichbiah's ADA ARM and Brinch Hansen's Distributed Processes DP Brinch Hansen This characterization has been certified through soundness and completeness proofs Apt 2 Gerth As in the interference freedom test this characterization consists of two stages a local sequential stage and a global stage

Verification of Sequential and Concurrent Programs Krzysztof R. Apt, Ernst-Rüdiger Olderog, 2013-03-09 Computer programs are becoming more and more part of systems that we use to rely on in our daily lives The proper functioning and safety of these systems is of paramount importance A major challenger for computer science is to develop methods that ensure program correctness This textbook provides a structured introduction to program verification using an assertional approach so named because it relies on the use of assertions that are attached to program control points Sequential programs in the form of deterministic and nondeterministic programs and concurrent programs in the form of parallel and distributed programs are considered within the context of their partial and total correctness The use of these proof systems is demonstrated with the help of case studies In particular solutions to classical problems such as mutual exclusion are formally verified Each chapter concludes with exercises and bibliographic remarks for further reading As a result this text will be appropriate for either an introductory course on program verification for upper division of undergraduate studies or for graduate studies It can also be used as an introduction to operational semantics Outlines of possible courses are presented in the preface of the book
