

## Laboratory Activity #1 — Student Laboratory Packet

**Relationships and Biodiversity***A Laboratory Activity for the Living Environment***Introduction**

*Botana curus* is a valuable plant because it produces Curol, a compound used for treating certain kinds of cancer. Curol cannot be produced in the laboratory. *Botana curus* grows very slowly and is on the endangered species list, so its ability to provide Curol in large quantities is limited.

Species that are more closely related to *Botana curus* are more likely to produce the important substance Curol. Three similar plant species that are plentiful (X, Y, and Z) may be related to *Botana curus*. You will work as a researcher to:

- gather structural and molecular evidence to determine which plant species is most closely related to the hypothetical species, *Botana curus*
- use this evidence to decide which plant species is most likely to serve as a source of the important substance Curol

**Safety**

- You will need to wear goggles while conducting Tests 4 and 5.
- Do not eat or drink anything in the laboratory while doing this laboratory activity.

*Important Note: Record all of your data and answers on these laboratory sheets. You will need to keep them for review before the Regents Examination. Later, you will need to transfer your answers to a separate Student Answer Packet. Your teacher will use the packet in grading your work, and the school will retain it as evidence of your completion of the laboratory requirement for the Living Environment Regents Examination.*

**Structural Evidence for Relationships**

Perform the following tests and record your observations in Table 1 on page 8 of this packet. Use a hand lens or microscope as needed.

*Test 1-Structural Characteristics of Plants*

- Do not remove the plant samples from the plastic bags/cards.
- Compare the structural characteristics of the plant samples. Record your observations in Table 1 (see page 8).

*Test 2-Structural Characteristics of Seeds*

- Do not remove the seed samples from the plastic bags/cards.
- Compare the structural characteristics of the seed samples. Record your observations in Table 1.

"Relationships and Biodiversity" is a laboratory activity produced by the State Education Department for use in fulfilling part of the laboratory requirement for the Regents Examination in Living Environment. Reproducing any part of this laboratory activity by other than New York State school personnel is illegal. **Nature's Tapestry: Uncovering the Beauty and Importance of Biodiversity** Juan Armando Sánchez, 2023-10-09 We cannot separate human beings from biodiversity Our vital functions and our health are synergistic with other species The number of microorganisms we live with is greater than the total number of cells in our bodies So separation from biodiversity and its loss are the greatest threats to human survival and the current model for human development affects our very lives We must integrate marine and terrestrial life to understand our interdependence with biodiversity Colombia a megadiverse country with access to two oceans is the perfect canvas on which to illustrate this message nature has sustainable and straightforward solutions to society's emerging problems The new challenges of a changing environment raise increasingly relevant questions that we must address to prosper as individuals and as a society Can we prevent a new pandemic of viral origin How will we feed a constantly growing population How will the extinction of biological species affect us Do we function the same as all other living beings Are our bodies entire ecosystems for other species Is there a better model for economic development This book presents an approach to these discussions based on Colombia's biodiversity to uncover biodiversity's beauty and importance our nature's tapestry What we have here is an opportunity that we cannot miss

**Effects of Non-Random Sources of Alteration on Biodiversity and Ecosystem Functioning** Tian Zhao, Chuanbo Guo, Chao Wang, Chunsheng Liu, Paraskevi Manolaki, 2023-11-15 Understanding how biological diversity affects ecosystem functioning is a key question in modern ecology This is of particular importance in the general context of recent global changes caused by human activities such as water abstraction flow regulation shifts in agricultural practices contamination climate changes and biological invasions These changes are affecting biodiversity ecosystem functioning and their complex interactions simultaneously However our ability to understand how genes individuals populations communities and ecosystems may respond to such changes is limited despite ecologists frequently being requested to provide policymakers and managers with predictions Indeed the species that composed biodiversity can establish complex trophic links between them in the ecosystems This structure of food webs is under the permanent constraint of community dynamics which connects species populations communities and ecosystems Therefore the response of food webs to perturbations can help ecologists to better understand the relationship between biological diversity and ecosystem functioning

**Key Determinants of Biodiversity, Ecosystem Functioning and Restoration in Climate Change Sensitive Ecosystems** Hui Zhang,Xiang Liu,Robert John,2023-11-27 Human activities such as agriculture and mining have led to serious negative effects on biodiversity and important ecosystem services including biodiversity loss and climate change Thus it is important to quantify the key determinants of biodiversity ecosystem functioning and ecological restoration of degraded plant communities in climate change sensitive ecosystems i e subalpine and alpine meadow communities in Qinghai tropical rainforests and tropical mountains In this way effective management policy and methods can be developed to reduce the influence of climate change on these climate change sensitive ecosystems The aforementioned human activities continue to destroy and degrade plant communities and ecosystem functioning Climatic changes further exacerbate negative impacts and may trigger rapid loss of species precipitate decline and changes in the flows of ecosystem goods and services As the collective anthropogenic influence intensifies some ecosystems may be more sensitive than others to these changes Ecosystems that contribute greatly to human well being through the delivery of biodiversity and ecosystem benefits should be the focus of particular concern There are key knowledge gaps on the specific nature of anthropogenic impacts species and ecosystem responses and possible management and mitigation measures Comprehensive documentation of these aspects from highly sensitive regions and ecosystems is urgently needed particularly at fine scales which is relevant for developing management and mitigation measures Pathways such as ecological restoration can offset some of the impacts but even quantifying the impacts of observed and anticipated changes is far from adequate and other mitigation measures must be considered
