Student Exploration: Populations and Samples

Readings: Frequency distribution, normal distribution, population, sample

Prior Knowledge Questions (What do you already know about this topic?)

a. **Frequency distribution** indicates how many times some value occurs within a group of values. Suppose a large number of people were surveyed on how many hours per week they can work. The frequency of that data shows the frequency distribution of that variable, without sampling.

b. How would you approximate shape of the distribution?

c. As the curve grows to the right, which value gets closer to frequency distribution might also find the same shape could describe the number before sampling?

Classroom Setup

In many cases, a population frequency distribution is skewed to the right. This means that the majority of the population has a value that is less than the mean. This is the case with the number of hours per week people can work.

a. The normal distribution is the standard approximation of the frequency distribution described above. It is a good approximation when the population is skewed to the right. There is a theoretical mean distribution. Find mean _____ How mean _____

b. About the simulation speed of the data in the left side of the page (a) to start taking samples from population. Click **Reset** (a) when the simulation is at about 10.

i. What is the mean of each sample? (Mean) _____ How mean _____

ii. How many of the sample means is the population mean? _____
