**Strategic allocation of resources using linear programming model with parametric analysis: in MATLAB and Excel Solver** Dinesh Gupta, 2014-05-01 Since the late 1940s linear programming models have been used for many different purposes. Airline companies apply these models to optimize their use of planes and staff. NASA has been using them for years to optimize their use of limited resources. Oil companies use them to optimize their refinery operations. Small and medium sized businesses use linear programming to solve a huge variety of problems often involving resource allocation. In my study a typical product mix problem in a manufacturing system producing two products each product consists of two sub assemblies is solved for its optimal solution through the use of the latest versions of MATLAB having the command `simlp` which is very much like `linprog`. As analysts we try to find a good enough solution for the decision maker to make a final decision. Our attempt is to give the mathematical description of the product mix optimization problem and bring the problem into a form ready to call MATLAB's `simlp` command. The objective of this study is to find the best product mix that maximizes profit. The graph obtained using MATLAB commands gives the shaded area enclosed by the constraints called the feasible region which is the set of points satisfying all the constraints. To find the optimal solution we look at the lines of equal profit to find the corner of the feasible region which yields the highest profit. This corner can be found out at the farthest line of equal profit which still touches the feasible region. The most critical part is the sensitivity analysis using Excel Solver and Parametric Analysis using computer software which allows us to study the effect on optimal solution due to discrete and continuous change in parameters of the LP model including to identify bottlenecks. We have examined other options like product outsourcing, one time cost, cross training of one operator, manufacturing of hypothetical third product on under utilized machines and optimal sequencing of jobs on machines.

**Introduction to Business Analytics Using Simulation** Jonathan P. Pinder, 2022-02-06 Introduction to Business Analytics Using Simulation Second Edition employs an innovative strategy to teach business analytics. The book uses simulation modeling and analysis as mechanisms to introduce and link predictive and prescriptive modeling. Because managers can't fully assess what will happen in the future but must still make decisions the book treats uncertainty as an essential element in decision making. Its use of simulation gives readers a superior way of analyzing past data, understanding an uncertain future and optimizing results to select the best decision. With its focus on uncertainty and variability this book provides a comprehensive foundation for business analytics. Students will gain a better understanding of fundamental statistical concepts that are essential to marketing research, Six Sigma, financial analysis and business analytics. Teaches managers how they can use business analytics to formulate and solve business problems to

enhance managerial decision making Explains the processes needed to develop report and analyze business data Describes how to use and apply business analytics software Offers expanded coverage on the value and application of prescriptive analytics Includes a wealth of illustrative exercises that are newly organized by difficulty level Winner of the 2017 Textbook and Academic Authors Association s TAA Most Promising New Textbook Award in the prior edition      **Management**
