

### Pre-Lab

**I. Title:** Identification of an Impure Unknown Using Recrystallization and Mixed Melting Point Experiment

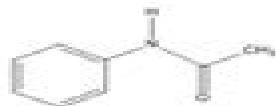

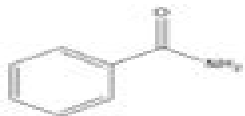

**II. Introduction:**

The lab consists of using the recrystallization process which purifies organic solid compounds. The goal is to dissolve and subsequently crystallize a pure substance from the solution to identify an unknown. The purpose of the experiment will be to purify an impure sample of an unknown organic compound through recrystallization and identify the unknown by establishing its melting point. Recrystallization will allow for an effective way of obtaining a pure sample. There will be five steps of recrystallization used in the lab:

1. Choosing an appropriate solvent for the recrystallization
2. Dissolving the impure mixture in the hot solvent
3. Removing the insoluble impurities from the hot solvent via filtration
4. Cooling to crystallize the pure compound from the solution
5. Isolating the pure compound via suction filtration

The melting point of a chemical substance is the temperature at which its solid and liquid phases are in equilibrium. The mixed melting point experiment will determine the melting point of the unknown solid to verify the identity of the unknown compound.

**III. Table of Regents:**

Compound Name	Structure	MW (g/mol)	MP (°C)
Acetamide		135.16	114.3
Benzamide		121.14	127-130
