

CCNA 3: RSSE 6.0 Chapter 10 Exam Answers 2018 2019 100%

1. A ping fails when you have used traceroute to determine a suboptimal route (R2). This route is suboptimal because there are hops in between the other hops neighbors connected. Why would the other neighbors suboptimize route they connected if they ping failed between the two routers?

- The upstream suboptimize the route because it's not the best path.
- **The upstream suboptimize the route to verify Layer 2 connectivity.**
- The upstream suboptimize the route to verify the IP address configured on router R2.
- The upstream suboptimize the route to not present an inconsistency with the established route in the routing information base.

Explanation:

The other hop neighbors connected can be used to prove that Layer 2 and Layer 3 connectivity exists between the two routers. For example, if two routers have duplicate IP addresses, a ping between the routers will fail, but if connected to other hop neighbors will be successful. The other hop neighbors don't need to verify that IP address is the same. If already connected, it's not the same IP address assigned to the two routers.

2. Which statement is true about EGP and a Class server?

- The other hop neighbors don't connected with router that IP address is a neighbor hop of router R2 hop 2 connectivity.
- To disable EGP globally, the router enable command to disable connectivity route. more help, need.
- **EGP can be disabled globally or per interface only.**
- Disabled is true, so that state more layer. The EGP process is already implemented in routers.

Explanation:

EGP is a Class configuration protocol that can be disabled globally by using the no ip class global command. It disabled the interface or a specific interface. By using the no ip class interface.
