An experimental evaluation of static and dynamic type systems** Sebastian Kleinschmager,2013-06-01 Programming languages that use the object oriented approach have been around for quite a while now Most of them use either a static or a dynamic type system However both types are very common in the industry But in spite of their common use in science and practice only very few scientific studies have tried to evaluate the two type systems usefulness in certain scenarios There are arguments for both systems For example static type systems are said to aid the programmer in the prevention of type errors and further they provide documentation help for there is an explicit need to annotate variables and methods with their respective types This book describes a controlled experiment that was conducted to shed some light into the presented matter Which of the type systems can live up to its promises Is one of these better suited for a particular task And which type system is the most supportive in a problem solving The main hypothesis claims that a static type system is faster in a problem solving in use of an undocumented API Thus in the study the participants need to solve different programming tasks in an undocumented API environment with the help of the static type system Java and the dynamic type system Groovy The author starts with a short introduction to the topic the experimentation and the motivation Then he describes a list of related works and proceeds to the description of the experiment its evaluation and finally the discussion of the results This book should prove interesting reading for anyone who is interested in the mechanics that drive programmer productivity and performance that depend on the kind of technology used as well as for anyone who might be interested in empirical research in software engineering in general *Scientific and Technical Aerospace Reports* ,1986 *Solid Fuels and Heavy Hydrocarbon Liquids* Rafael Kandiyoti,Alan Herod,Keith D Bartle,Trevor J Morgan,2016-12-23 *Solid Fuels and Heavy Hydrocarbon Liquids* Thermal Characterisation and Analysis Second Edition integrates the developments that have taken place since publication of the first edition in 2006 This updated material includes new insights that help unify the thermochemical reactions of biomass and coal as well as new developments in analytical techniques including new applications in size exclusion chromatography several mass spectrometric techniques and new applications of nuclear magnetic spectroscopy to the characterization of heavy

hydrocarbon liquids The topics covered are essential for the energy and fuels research community including academics students and research engineers working in the power oil and gas and renewable energy industries Includes a description of the principles and design of experiments used for assessing the reactivities reactions and reaction products of coal and lignocellulosic biomass Features an outline of recent advances in the analytical methodology for characterizing heavy petroleum derived fractions and products from the thermochemical reactions of coal and biomass Provides a link between samples reaction conditions and product characteristics to help in the search for upgrading methods for heavy hydrocarbon liquids
