Plants like sunflowers and wheat respond to light, which causes them to grow towards it. This is called positive phototropism. While carrots are negative to light, they grow towards the light because when sunlight hits them, plants move towards it to get more energy. Plants have hairs called guard cells that surround tiny pores called stomata. Guard cells open and close to allow water and carbon dioxide to enter the plant. When light hits them, guard cells open to allow more light to enter. As a result, the plant grows towards the light. Conversely, plants move away from light if there is too much light. Plants are sensitive to light because they need light for photosynthesis, which uses light energy to make glucose. Glucose is a form of energy. Plants also need water and carbon dioxide to make glucose. Water comes from the soil and carbon dioxide comes from the air. Plants have tiny pores called stomata on their leaves that open and close to allow water and carbon dioxide in and out of the plant. When light hits the stomata, they open more widely so more carbon dioxide can enter the plant. As a result, the plant grows towards the light.

Plant tropisms can also result off gravity, water or chemicals. Roots grow downwards from the soil. This type of growth occurs without the presence of a plant organ, such as leaves or roots, of any kind. Between other cells in the root, these cells control the growth of the cells above the root. The growth of the root stimulates the growth of the upper cells. However, when light is present, the upper cells are sensitive to light. Plants are sensitive to light, like humans, but through the help of hormones. These hormones cause the differentiated growth of the plant organs, causing the plant to curve in the direction of the stimulus. In the direction of the stimulus the plant has positive gravitropism. Conversely, plants move away from the stimulus if the stimulus is unpleasant. For example, plants move away from water if the water is too strong. They move away from water because water is unpleasant.

Photosynthesis

Photosynthesis is the process of making glucose off sunlight and water. It responds to light, water and carbon dioxide. It is an example of hormesis. When the light is stronger, the plant grows better. When the light is weaker, the plant grows worse. When the water is stronger, the plant grows better. When the water is weaker, the plant grows worse. When the carbon dioxide is stronger, the plant grows better. When the carbon dioxide is weaker, the plant grows worse. Photosynthesis is the process of making glucose off sunlight, water and carbon dioxide. It is an example of hormesis. When the light is stronger, the plant grows better. When the light is weaker, the plant grows worse. When the water is stronger, the plant grows better. When the water is weaker, the plant grows worse.
