**Acoustic Waves** Don Dissanayake, 2010-09-28 SAW devices are widely used in multitude of device concepts mainly in MEMS and communication electronics. As such SAW based micro sensors, actuators and communication electronic devices are well known applications of SAW technology. For example SAW based passive micro sensors are capable of measuring physical properties such as temperature, pressure, variation in chemical properties and SAW based communication devices perform a range of signal processing functions such as delay lines, filters, resonators, pulse compressors and convolvers. In recent decades SAW based low powered actuators and microfluidic devices have significantly added a new dimension to SAW technology. This book consists of 20 exciting chapters composed by researchers and engineers active in the field of SAW technology, biomedical and other related engineering disciplines. The topics range from basic SAW theory, materials and phenomena to advanced applications such as sensors, actuators and communication systems. As such in addition to theoretical analysis and numerical modelling such as Finite Element Modelling (FEM) and Finite Difference Methods (FDM) of SAW devices SAW based actuators and micro motors and SAW based micro sensors are some of the exciting applications presented in this book. This collection of up to date information and research outcomes on SAW technology will be of great interest not only to all those working in SAW based technology but also to many more who stand to benefit from an insight into the rich opportunities that this technology has to offer, especially to develop advanced low powered biomedical implants and passive communication devices.

*Designing Wireless Sensor Network Solutions for Tactical ISR* Timothy D. Cole, 2020-09-30 This comprehensive resource demonstrates how wireless sensor network (WSN) systems, a key element of the Internet of Things (IoT), are designed and evaluated to solve problems associated with autonomous sensing systems. Functional blocks that form WSN based systems are described chapter by chapter, providing the reader with a progressive learning path through all aspects of designing remote sensing capabilities using a WSN based system. The development and a full description of fundamental performance equations and technological solutions required by these real time systems are included. This book explores the objectives and goals associated with tactical intelligence surveillance and reconnaissance (TISR) missions. Readers gain insight into the correlation between fine grained sensor resolution associated with WSN based system complexities and the difficult requirements associated with TISR missions. The book demonstrates how to wield emergent technologies to arrive at reliable and robust wireless networking for TISR and associated tasks using low cost, low power, persistent sensor nodes. WSN is broken down into constituent subsystems, key components, functional descriptions and attendant mathematical descriptions. This resource explains how the design of each element can be approached and successfully integrated into a viable and responsive sensor system that is

autonomous adaptable to mission objectives and environments and deployable worldwide It also provides examples of what not to do based on lessons learned from past and current systems that failed to provide end users with the required information Chapters are linked together in order of system assembly concepts to operation to provide the reader with a full toolset that can help deliver versatility in design decisions solutions and understanding of such systems end to end
