Comments on Long-term Aspects of Renewable Vs Nonrenewable Resource Substitution, 1980 There are many cases where materials applications involve the use of nonrenewable materials In some instances renewable resources can be substituted for nonrenewable ones in other cases there are no readily feasible renewable resource substitutes for certain nonrenewable materials applications The author points out advantages and limitations of renewable resources as substitutes for nonrenewable resources with particular emphasis on the longer term when economic resources of some of the more limited chemical elements will be starting to run out or will or least become too expensive to use except in absolutely necessary nonsubstitutable uses On the one hand renewable resources will continue to become available through natural processes in some cases augmented by modern technology but only at some maximum level For example the amount of hydroelectric power available in the world is determined by rainfall and topography On the other hand nonrenewable resources are generally regarded as being material sources that once used are gone forever This is certainly true for fossil fuels where current demands are many orders of magnitude larger than rates of formation of new coal and petroleum It is not true however for some of the atmospheric gases e g nitrogen and argon which are returned to the atmosphere either directly or through biological processes after use so that they are truly renewable resources

Making Good Choices About Nonrenewable Resources Paula
