

# Motion and Forces Study Guide

- I. What is motion?
- Change in position
  - Forces put things in motion
    - Speed
      - How fast something is moving.
      - $\text{Speed} = \text{Distance} / \text{Time}$
    - Velocity
      - Speed in a given direction
      - Ex: An airplane goes 150m/hr EAST
  - Acceleration
    - Change in speed or direction
      - Speeding up
      - Slowing down
      - Turning

- II. What is a Force
- A push or a pull
  - Measured in Newtons
  - Shown with arrows
  - Can be balanced or unbalanced
    - Balanced forces are equal and opposite. Motion does not change.
    - Unbalanced forces create a change in motion.

- III. Friction
- Opposes motion (slows things down)
  - Can create heat and can wear away surface areas
  - Caused by surface types
    - The rougher the surface, the more friction
    - Lubricants reduce friction

- IV. Gravity
- Force of attraction between all objects
    - More mass = more gravitational pull
    - Closer together = more gravitational pull
  - Weight is a measure of the pull of gravity
    - Weight will change based on location in the solar system
    - Objects weigh less on the moon than on earth

Friction is a force that acts in an opposite direction to movement.

**The Pedagogy of Physical Science** David Heywood,Joan Parker,2009-12-16 In the science classroom there are some ideas that are as difficult for young students to grasp as they are for teachers to explain Forces electricity light and basic astronomy are all examples of conceptual domains that come into this category How should a teacher teach them The authors of this monograph reject the traditional separation of subject and pedagogic knowledge They believe that to develop effective teaching for meaningful learning in science we must identify how teachers themselves interpret difficult ideas in science and in particular what supports their own learning in coming to a professional understanding of how to teach science concepts to young children To do so they analyzed trainee and practising teachers responses to engaging with difficult ideas when learning science in higher education settings The text demonstrates how professional insight emerges as teachers identify the elements that supported their understanding during their own learning In this paradigm professional awareness derives from the practitioner interrogating their own learning and identifying implications for their teaching of science The book draws on a significant body of critically analysed empirical evidence collated and documented over a five year period involving large numbers of trainee and practising teachers It concludes that it is essential to problematize subject knowledge both for learner and teacher The book s theoretical perspective draws on the field of cognitive psychology in learning In particular the role of metacognition and cognitive conflict in learning are examined and subsequently applied in a range of contexts The work offers a unique and refreshing approach in addressing the important professional dimension of supporting teacher understanding of pedagogy and critically examines assumptions in contemporary debates about constructivism in science education
