

## **Magnetism:**

**Magnetism:** refers to the properties and interactions of magnets in which there is a force of attraction or repulsion between like or unlike poles.

Strength of force between two magnets depends on the distance between them

**Magnetic Field:** exerts a force on other magnets and objects made of magnetic materials (strongest closed to magnet)

All Magnets have a north pole and a south pole

Like poles repel

unlike poles attract

Only a few metals, such as iron, cobalt, and nickel are attracted to magnets or can be made into permanent magnets.

**Magnetic Domains:** a group of atoms with aligned magnetic poles (too small to be seen with eye)

**Permanent magnets:** are made by placing a magnetic material in a strong magnetic field, forcing magnetic domains to line up.

### **Magnetic Poles:**

-Magnetic poles are where the magnetic force exerted by the magnet is strongest

-all magnets have a north pole and south pole

-for a bar magnet, the north and south poles are at the opposite ends.

-the two ends of a horseshoe-shaped magnet are the north and south poles

-a magnet shaped like a disc has opposite poles on the top and bottom of the disk

-magnetic field lines always connect the north pole and the south pole of a magnet
