Reasoning Tests For Kids:

Intelligence Tests for Children C.W. Valentine, 2015-06-05 Originally published in 1945 this title was intended mainly for use by teachers wishing to test children from ages 2-8 in order to establish their intelligence. Based on feedback to the author this revised edition also includes tests for children up to the age of 15. The tests were used to give a teacher some idea of how much could be expected of each child so that the class when practicable could be divided into groups of varying abilities which could proceed at paces suited to their respective capacities. It was felt that if inborn intellectual deficiencies could be identified at an early age the children could have special treatment or in certain cases be placed in a special school rather than be potentially written off as lazy. Today this can be read and enjoyed in its historical context. *Dynamic Assessment of Young Children* David Tzuriel, 2012-12-06 Dynamic interactive assessment has been a long time coming. It has been almost a century since Alfred Binet suggested that assessment of the processes of learning should constitute a priority in the mental testing movement and over 60 years since Andre Rey made the same suggestion. An important model that supports many contemporary approaches to flexible or process assessment was offered by Vygotsky in the 1920s. The groundbreaking work by Reuven Feuerstein and his Swiss colleagues on process assessment of North African Jewish children was done in the early 1950s. In the intervening years almost every serious psychometrist has at one time or another called for emphasis on assessment of the of learning rather than an exclusive emphasis on assessment of the processes/products of prior opportunities to learn. One has to wonder why we have had to wait so long for formalization and instrumentation of the methods for doing just that. Of course we psychologists like to do what we do well and we have learned to do static normative assessment especially of intelligence very well indeed. Unfortunately it is also true that dynamic interactive assessment has not attracted or fueled the volume of high quality research that is still going to be necessary if it is to survive as a widely used supplement to static normative testing. This volume incorporating a strong research base goes a long way toward remediation of that situation. **Practice of Child-Clinical Neuropsychology** Byron Rourke, Sean Rourke, Harry van der Vlugt, 2002-01-01 The aim of this work is to provide a comprehensive treatment oriented introduction to the practice of child clinical neuropsychology focusing exclusively on the assessment of children and adolescents. The book has been designed specifically for those who wish to pursue education and training in this area of professional endeavor. The volume gives consideration to the following issues: treatment oriented model of neuropsychological assessment; specification of brain-behavior relationships; dimensions of neuropsychological assessment; psychometric considerations; validity issues; modes of approach to neuropsychological interpretation; influence of demands of the environment; prediction of behavioral outcomes; development of realistic remedial plans; and availability of resources for effective implementation of remedial plan and continuing relationship between neuropsychological assessment and intervention principles and hypotheses concerning the remediation of brain impairments in childhood and early adolescence. Variables related to the known or hypothesized brain

lesion determination of the child's remedial needs and remediable capacities approaches to treatment general treatment strategies formats for intervention treatment styles and techniques and implementation of the remedial plan learning disabilities empirically derived LD subtypes neuropsychological profiles psychosocial typologies and implications for treatment and case studies nonverbal learning disabilities and basic phonological processing disorder and neurological disease disorder and dysfunction approach to characterization of neurological disorders and case studies stroke Asperger syndrome traumatic brain injury brain tumor and Tourette syndrome This book will be of critical interest to child clinical psychologists neuropsychologists who specialize in the assessment and or treatment of adults with brain impairment and have some interest in childhood disorders pediatric neurologists child psychiatrists and a host of other professionals whose practice brings them in contact with children whose behavior may be affected by brain dysfunction Indeed for all of these professionals and those in training to become such this book will serve as a comprehensive introduction to a systematic approach to neuropsychological assessment and intervention for children and adolescents with suspected or established brain impairment
