Planet Earth rotates once around its axis every 24 hours. We call this period of time a day. There are 365 days in a year. It takes one year for the Earth to revolve once around the sun. If I am 12/13 years old [enter your own age], then I have made 12/13 trips around the sun during my life.

Earth's orbit around the sun traces out an almost perfect circle. Thus the distance between the sun and Earth does not change very much over the course of a year. So the reason that temperatures are warmer in the summer and colder in the winter is the tilt of Earth's rotation axis. Earth's seasons are NOT caused by being closer or farther from the sun. Earth's rotational axis is tilted 23.5 degrees toward a distant star called Polaris (The North Star). As Earth moves around the sun, Earth's North Pole stays pointed toward this star, which is 500 light-years from our solar system. Earth's axis remains tilted toward Polaris, but how Earth is leaning relative to the Sun changes as Earth moves in its orbit around the Sun.

When Earth is located on one side of the Sun, the tilt causes the northern hemisphere to be leaning toward the sun. When earth is on the opposite side of the sun, this same tilt towards Polaris causes the Northern Hemisphere to be leaning away from the sun. When the northern hemisphere is leaning towards the sun, the season is summer in the Northern hemisphere and winter in the southern hemisphere. When the northern hemisphere is leaning away from the sun, the season is winter in the northern hemisphere and summer in the Southern hemisphere.
