

PYE MP THREE-BAND FOUR

Three valve, plus rectifier, three waveband table superhet for 200-250 volts, 40-100 cycle supplies, price 8½ gns.

CIRCUIT OUTLINE

Coupled circuits are used on all three bands for the input to V₁, a triode hexode, which has AVC and a conventional oscillator circuit. Inductance adjusted intermediate frequency transformers are used, the primary of the first being in the anode circuit of V₁.

The secondary winding of this transformer works into the grid of V₂, a "sliding screen" pentode, AVC again being provided. A second IF transformer couples the IF amplifier to the signal diode, which is part of V₃, a double diode pentode.

Use is made of a conventional demodulation circuit and filter. The other diode is used for AVC. Signal voltages from the diode lead are taken through a coupling condenser to the volume control which works in the grid circuit of the pentode portion. The volume control is of the tone compensating type with a tapping and a fixed network.

The anode circuit of V₃ contains the speaker output transformer and has a short bypassing condenser and a tone control circuit comprising an optional network of either a further condenser and resistance or the condenser alone.

Power supply is by means of a full-wave rectifier, V₄, in conjunction with the speaker field and fixed condensers for smoothing.

CONSTRUCTIONAL FEATURES

THERE are several slight variations in the receiver when compared with the makers' circuit. It will be noticed that there is a grid stopper in the lead to the grid of V₁. This will be found adjacent to the grid terminal.

The oscillator coil arrangements are different from the original circuit, the wound

windings being returned to the coupling condenser and not the chassis as shown in the Pye diagram.

Wave-change Switches.

All the switching is accomplished by a single rotor. The first wipe selects the tuned input circuit and the second wipe is used for shorting the untuned coils. The third and fourth wipes select the untuned and tuned oscillator wipes respectively, the fifth wipe again being used for shorting purposes.

It will be noticed that the additional wipes are provided by special moving contacts on the rotor due to which flexible leads are connected.

Chassis Removal.

Chassis removal is extremely simple. The chassis is retained by four bolts which, on removal, leave it completely free. It can then be withdrawn after removing the four knobs. These are held by grub screws.

The speaker and transformer are mounted separately, and some care is necessary in removing the connections. On the transformer there are four tags. Reading from the top to the bottom, the colours of the leads are as follows: Black, rose, green, yellow. The top tag with the black lead is also connected to one terminal on the

speaker and the other is connected to the red lead from the set.

The speaker itself can be released by four nuts, or if desired, the complete handle board with the transformer secured to it can be removed.

Alignment

IF Circuit. (Intermediate frequency 455 kcs.)

Connect output meter to set and generator to V₁ grid and chassis, through a 0.1 mfd condenser, and return the grid to the AVC line through a .05 megohm resistance. Inject a modulated 455 kcs. signal and move the outer coils on the inductance-adjusted intermediate transformers in either direction until maximum output is obtained.

Make the adjustment on the second transformer first and use a low input below the AVC level.

Medium Waves. (530-550 metres.)

Connect the generator to the aerial and earth sockets and tune set and generator to 530 metres.

Adjust T₁ for resonance and T₂ for maximum output.

Tune generator and receiver to 520 metres and check the calibration.

(Continued in col. 2 opposite page.)
