

Phlebotomy

Essentials of Performing Phlebotomy, Circulatory System, Blood Tests, Tools, Techniques, Equipment, Color-Coded Taps & Terminology

OVERVIEW

- **Phlebotomy** is derived from the Greek, *phlebo-* (relating to veins), and *-tomy* (relating to cutting).
- Phlebotomy (a.k.a., venipuncture) can be summarized as the puncture of a vein for blood collection or removal.
- The main purpose of phlebotomy is to obtain blood for diagnostic testing.
- It involves highly developed and rigorously tested procedures and equipment to ensure the **safety and comfort of the patient**, to guarantee the **integrity of the sample collected**, and to **minimize infectious disease transmission**.
- Phlebotomy skills and responsibilities are performed in a variety of healthcare settings, ranging from **hospital care units to home-health settings**.
- Phlebotomy practice is widely performed by all types of healthcare professionals, including:
 - Nurses
 - Respiratory therapists
 - Emergency medical technicians (EMTs)
 - Clinical laboratory professionals
- In the hospital and other settings, the person performing the venipuncture procedure is often called a **phlebotomist**.

Note: See page 6 for a **Glossary of Phlebotomy Terminology**.

HOW PHLEBOTOMY IS PERFORMED

Note: Detailed procedural steps are outlined throughout the sections of this guide.

Routine Venipuncture Procedure

- Register patient
 - Verify:
 - Full name
 - Sex
 - Date of birth
 - Full address
 - Government photo ID card
- Receive test request
 - Verify completeness of test request and match with labels
 - Resolve discrepancies before blood collection; contact responsible party for clarifications.
 - Greet and approach patient
- Introduce yourself and explain why you are there
- Assess patient's specific health conditions
- Verify availability of venipuncture supplies and equipment:
 - Syringe container
 - Tubes
 - Gloves
 - Other
 - Tourniquet
 - Needle
 - Needle adapter
- Identify patient
 - Use extra care when there is potential for confusion among patients.
 - Question patient and verify according to their ID and ability to respond.
 - Assign a temporary ID for emergencies, if needed.
- Assess pre-collection requirements
 - Obtain informed consent from patient or guardian.
 - Assess physiological factors that can affect test results (e.g., contact, tolerance tests, and therapy monitoring).
- Clean hands
- Perform appropriate hand hygiene immediately before patient contact
- Assess patient
 - Identify and address potential complications
 - Avoid latex when there is patient hypersensitivity
 - Ensure there is nothing in patient's mouth unless medically required
- Position and prepare the patient so patient is seated or recumbent with their arm extended for both safety and comfort
- Specimen collection
 - Gather supplies
 - Devices must NOT be preassembled
- Select site:
 - Apply tourniquet 3-4 inches above the puncture site for no longer than one minute; a tourniquet left on too long may cause:
 - Hemocoagulation (too many blood elements in plasma)
 - Hemolysis (disintegration of red blood cells)
 - Petechiae (red spots on the skin)
 - Patient may clench and hold their fist if their veins are difficult to identify but must not pump hand
 - The best veins are in the antecubital fossa (inside of elbow); avoid the brachial artery and nerves.
 - First choice: Median aspect (center); median and lateral cubital vein
 - Second choice: Lateral aspect (outer); cephalic vein and accessory cephalic vein
 - Third choice: Medial aspect (inner); basilic vein and medial aspect of median cubital vein
 - Veins on the back of the hand are acceptable
 - Palpate the vein

- Veins are best located by feel
- Be sure to palpate with the tourniquet on
- Veins will feel spongy, bouncy, and firm.
- Written physician permission is required for nonpreferred areas and areas on the same side as a mastectomy.
- Apply a single-use or patient-dedicated tourniquet for no longer than one minute to access vein
- If venipuncture is unsuccessful, remove the tourniquet and do not reapply for at least two minutes after tourniquet removal
- Select and assemble appropriate needle and tubes
 - If blood is to be drawn from the hand or wrist, the phlebotomist may want to consider using a winged infusion set (a.k.a. butterfly needle) with a smaller needle
 - Avoid using a traditional needle and syringe when possible
- Don gloves and keep them intact
- Cleanse venipuncture site
 - Use a clean gauze pad with 70% isopropyl alcohol and back-and-forth motion unless antiseptic blood alcohol level or there is a facility-specified disinfectant for collecting a blood culture
 - Allow skin to dry before puncturing it
- Reassess if the venipuncture site is repalpated
- Insert needle and aspirate blood
 - First examine the needle; do not use if there are defects
 - Pre-evacuate tubes if required
 - Position arm downward when possible
 - Anchor vein from below and brace the arm
 - Inform patient of needle insertion
 - Hold the needle with your dominant hand
 - Angle the needle 15-30 degrees
 - Insert the needle barrel up and advance needle for free blood flow
 - Hold the needle steady in line with the vein and stabilize the device
 - Remove the needle if there is excessive pain or withdrawal of consent
 - Allow patient to open hand unless contraindicated; do not allow hand pumping
- The tourniquet stays on no longer than one minute
 - Remove the tourniquet when blood flow has been established, usually when the first tube is being filled
- Fill and mix collection tubes
 - Fill all tubes to full volume (no vacuum)
 - Remove tube and mix recommended number of times with gentle inversion (see Color-Coded Taps for Blood Draw, p. 5, for times)
 - Add additional tubes in order of draw, as prescribed
- Remove last tube (and tourniquet if still present) before needle withdrawal
