

SYSTEM OVERVIEW

The PCC is a microprocessor-based control for Onan generator sets. It provides fuel control and engine speed governing, main alternator voltage output regulation, and complete generator set control and monitoring. It also provides controls for automatic and semi-automatic synchronizing and automatic load sharing controls for both isolated bus or utility (mains) paralleling applications.

The operating software provides control of the generator set and its performance characteristics, and displays performance information on a digital display panel. It accepts menu-driven control and setup input from the push button switches on the front panel.

GENERATOR SET CONTROL FUNCTION

Figure 1-1 shows some of the control functions. A more complete block diagram is provided in Section 3. A system schematic is provided in Section 9.

The PCC monitors frequency from both the magnetic pick-up (MPU) and the main stator inputs. The control sends a low power pulse-width modulated (PWM) signal to the governor output module, which then sends an amplified signal to the engine fuel control.

The Bus PT module reduces the bus voltage to approximately 18 VAC and provides a signal to the control for reference in synchronizing the generator set to the system bus.

The external PT/CT module reduces generator voltage to approximately 18 VAC, and produces a representative AC voltage from CT output current. The voltage regulation function sends a low power PWM signal to the voltage regulator output module, which then sends an amplified signal to the exciter stator.

Oil, coolant, and exhaust temperatures are sensed by variable resistance element sensors. Oil pressure is sensed by a capacitive element active sensor.
