*Principles and Practice of Aviation Psychology* Pamela S. Tsang, Michael A. Vidulich, 2002-08-01 Covering field history and discussing actual modern day pilot actions and tasks the editors of this volume have integrated contributions from leaders in aviation to present psychological principles and research pertinent to the interface between a pilot and the

cockpit The book addresses the pilot's cognitive demands, capabilities and limitations which have important implications for operator selection and training as well as display control designs in the cockpit. It emphasizes scientific methods of achieving this understanding and implies that theories and principles of human behavior are shaped and improved by practical problems and applied studies. Practical Human Factors for Pilots Capt. David Moriarty, 2014-12-30 Practical Human Factors for Pilots bridges the divide between human factors research and one of the key industries that this research is meant to benefit: civil aviation. Human factors are now recognized as being at the core of aviation safety and the training syllabus that flight crew trainees have to follow reflects that. This book will help student pilots pass exams in human performance and limitations, successfully undergo multi-crew cooperation training and crew resource management (CRM) training and prepare them for assessment in non-technical skills during operator and license proficiency checks in the simulator and during line checks when operating flights. Each chapter begins with an explanation of the relevant science behind that particular subject along with mini case studies that demonstrate its relevance to commercial flight operations. Of particular focus are practical tools and techniques that students can learn in order to improve their performance as well as training tips for the instructor. Provides practical evidence-based guidance on issues often at the root of aircraft accidents. Uses international regulatory material. Includes concepts and theories that have practical relevance to flight operations. Covers relevant topics in a step-by-step manner describing how they apply to flight operations. Demonstrates how human decision making has been implicated in air accidents and equips the reader with tools to mitigate these risks. Gives instructors a reliable knowledge base on which to design and deliver effective training. Summarizes the current state of human factors training and assessment. **Aviation Psychology in Practice** Neil Johnston, Nick McDonald, 2017-09-29 This book seeks to extend the boundaries of aviation psychology in two interrelated ways: by broadening the focus of aviation psychology beyond the flight deck to the whole aviation system and by discussing new theoretical developments which are shaping this applied discipline. A key feature of these theoretical advances is that they are grounded in a more developed, ecologically valid understanding of practice. Among the issues addressed in this new integration of theory and practice are the following: what goes on in the flight deck is dependent on the wider organisational context; human factors issues in aircraft maintenance and grounding are critical to aviation safety; our capacity to learn from aviation accidents and incidents needs to be supported by more systematic human factors investigation and research; we must also develop our understanding of the human factors of accident survival as well as accident prevention; theories of crew coordination and decision making must be supported by an analysis of how decisions are actually made in the real world with all its stresses and constraints; training should be grounded in a thoroughgoing analysis of the complexity of the job and a full understanding of the training process itself. The text will be of interest to human factors researchers and practitioners in aviation and related areas. It will be of particular relevance to those who have a role in training, management or regulation throughout the aviation system.
