Application: Using Trigonometry

Many problems in daily life can be solved by using trigonometry. Often such problems involve an angle of elevation or an angle of depression.

Example: The angle of elevation from point A to the top of a cliff is 38° . If point A is 80 feet from the base of the cliff, how high is the cliff?

Let x represent the height of the cliff.
Then $\tan 38^\circ = \frac{x}{80}$.

$$80 \tan 38^\circ = x$$

Use a calculator set for the degree mode to find x .

ENTER: $80 \times 30 \text{ TAN} =$ 49.188021

The cliff is about 49 feet high.

Solve each problem. Round measures of segments to the nearest hundredth and measures of angles to the nearest degree.

- From the top of a tower, the angle of depression to a stake on the ground is 72° . The top of the tower is 30 feet above ground. How far is the stake from the foot of the tower?
- A tree 40 feet high casts a shadow 58 feet long. Find the measure of the angle of elevation of the sun.
- A ladder leaning against a house makes an angle of 60° with the ground. The foot of the ladder is 7 feet from the foot of the house. How long is the ladder?
- A balloon on a 40-foot string makes an angle of 50° with the ground. How high above the ground is the balloon if the hand of the person holding the balloon is 6 feet above the ground?
