

## L07: Cellular Respiration

### Guided Reading Qs (Do these before the Mastering Assignment.)

(Reading: 6.6 – 6.14) \*Note: this chapter can be dense at times. Follow the questions as you usually do to see my expectations for where you should be spending your time.

Tip: Watch the BioFlix animation in the Study Area of Mastering in this chapter. Then, put it on mute and see if you can narrate it!

#### Reading Objectives:

- Describe the inputs and outputs of each three stages of aerobic respiration and compare each stage for amount of ATP made and location in the cell.
- Explain why oxygen is necessary and what happens when oxygen is not available.
- Explain why lactic acid or ethyl alcohol is sometimes an output of cellular respiration.

#### Module 6.6: Overview

What are the names of the three stages of cellular respiration? Where does each stage take place?

What happens in this stage?

	Name	Location in cell it occurs?	Quick description of what happens:
Stage 1:	glycolysis	Cytosol	breaks down glucose into 2 molecules of a 3 carbon compound called pyruvate
Stage 2:	pyruvate oxidation citric acid cycle	Mitochondria	complete the breakdown of glucose to $\text{CO}_2$
Stage 3:	Oxidative phosphorylation	Inner mitochondrial membrane	Final step of cell resp. Electron transport chain

Look at the image below in your book and describe it. THEN see if you can fill this in. Try to tests yourself as you complete this—not just copy directly. Note what the little blue circles are—where do they come from and where do they go? What are the large yellow starbursts?
