Time Interval

- Inside layer of serous membrane, covers the lungs (visceral)
- and inside the chest wall (parietal).
- A potential space between the two layers is filled with serous fluid and prevents friction when we breathe.

The Advent

- Alveoli are **small air sacs** in the lungs which are specially adapted for **gas exchange**.

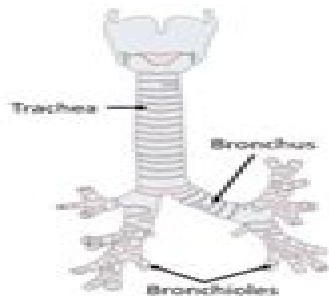

The walls of the alveoli separating the air from the blood are very thin allowing gases to diffuse quickly.
The blood supply to the alveoli is very good to constantly supply blood with little oxygen and a lot of carbon dioxide keeping a high concentration gradient.
The walls of the alveoli are kept moist to allow gases to dissolve into the fluid for gas exchange with the blood.

The bronchioles are small branches of the bronchi which link the alveoli in the lungs to the trachea. There are many bronchioles in the lungs. The bronchioles branch out like trees but contain around 500 million smooth muscle cells.
