

# The Urinary System

The urinary system is responsible for filtering waste from the blood, maintaining fluid balance, and regulating blood pressure. It consists of two kidneys, two ureters, a bladder, and a urethra. The kidneys are located in the back of the body, on either side of the spine. The ureters are tubes that carry urine from the kidneys to the bladder. The bladder is a sac-like organ that stores urine until it is ready to be expelled from the body through the urethra.

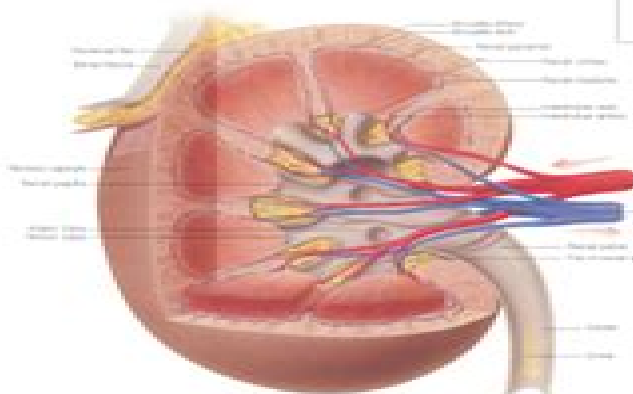

The urinary system is also responsible for maintaining the body's fluid balance. It does this by filtering out excess fluid and waste from the blood. The kidneys also play a role in regulating blood pressure by releasing a hormone called renin. Renin helps to control the production of a hormone called angiotensin, which in turn helps to regulate blood pressure.

## Structure of the kidneys

The kidneys are located in the back of the body, on either side of the spine. They are bean-shaped organs that are about 10 cm long and 5 cm wide. The kidneys are covered by a layer of fat called the renal capsule. The outer layer of the kidney is the renal cortex, and the inner layer is the renal medulla. The renal medulla is divided into several pyramids. The renal pelvis is the part of the kidney that leads to the ureter. The renal pelvis is divided into several calyces. The renal pelvis is the part of the kidney that leads to the ureter.

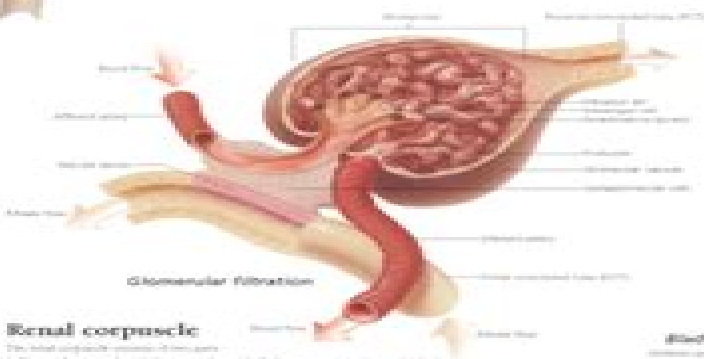

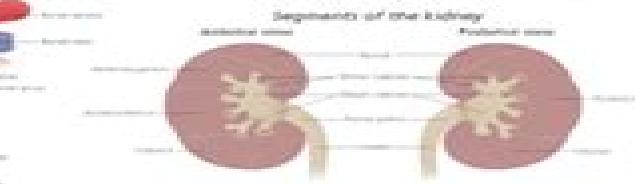

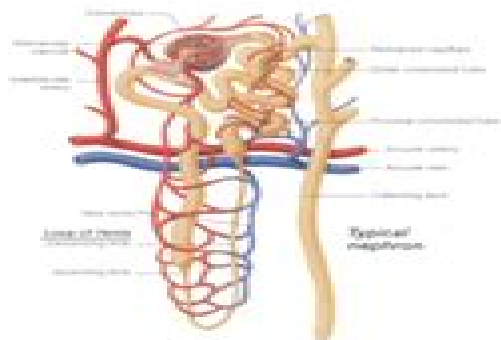

### Functions of the kidneys

The kidneys have several functions. They filter waste from the blood, maintain fluid balance, and regulate blood pressure. They also produce hormones that help to regulate the body's metabolism. The kidneys are also responsible for maintaining the body's acid-base balance.

## The nephron

The nephron is the basic functional unit of the kidney. It is responsible for filtering waste from the blood and maintaining fluid balance. Each kidney contains about 1 million nephrons. The nephron consists of a renal corpuscle and a renal tubule. The renal corpuscle is the part of the nephron that filters the blood. The renal tubule is the part of the nephron that carries the filtered fluid away from the renal corpuscle.

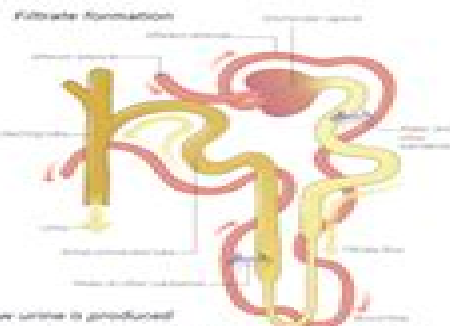

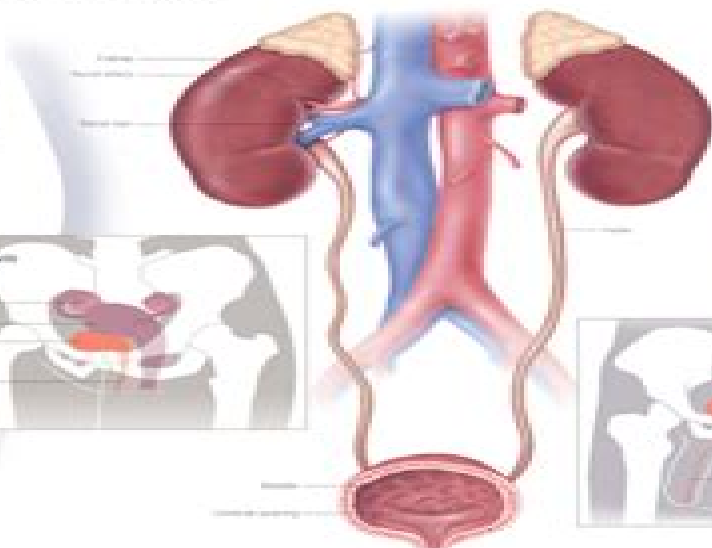

## Renal corpuscle

The renal corpuscle is the part of the nephron that filters the blood.

The renal corpuscle consists of two parts: the glomerulus and the Bowman's capsule.

The glomerulus is a cluster of capillaries that filter the blood. The Bowman's capsule is the part of the nephron that surrounds the glomerulus. The Bowman's capsule is divided into two parts: the parietal layer and the visceral layer.

The parietal layer is the outer layer of the Bowman's capsule. The visceral layer is the inner layer of the Bowman's capsule. The space between the parietal and visceral layers is called the Bowman's space. The Bowman's space is where the filtered fluid collects.

## How urine is produced

The kidneys produce about 1.5 liters of urine each day. The process of urine production is called micturition. It involves the filtration of blood by the renal corpuscle, the reabsorption of water and electrolytes by the renal tubule, and the secretion of waste products by the renal tubule.

- Any stages of urine formation**
- 1. Filtration** - The process of filtering blood by the renal corpuscle.
- 2. Reabsorption** - The process of reabsorbing water and electrolytes by the renal tubule.
- 3. Secretion** - The process of secreting waste products by the renal tubule.
