Barber,2016-10-13 A House in the Sun describes a number of experiments in solar house heating in American architectural engineering political economic and corporate contexts from the beginning of World War II until the late 1950s Houses were built across the Midwest Northeast and Southwestern United States and also proposed for sites in India South Africa and Morocco These experiments developed in parallel to transformations in the discussion of modern architecture relying on new materials and design ideas for both energy efficiency and claims to cultural relevance Architects were among the myriad cultural and scientific actors to see the solar house as an important designed element of the American future These experiments also developed as part of a wider analysis of the globe as an interconnected geophysical system Perceived resource limitations in the immediate postwar period led to new understandings of the relationship between energy technology and economy The solar house both as a charged object in the milieu of suburban expansion and as a means to raise the standard of living in developing economies became an important site for social technological and design experimentation This led to new forms of expertise in architecture and other professions Daniel Barber argues that this mid century interest in solar energy was one of the first episodes in which resource limitations were seen as an opportunity for design to attain new relevance for potential social and cultural transformations Furthermore the solar discussion established both an intellectual framework and a funding structure for the articulation of and response to global environmental concerns in subsequent decades In presenting evidence of

resource tensions at the beginning of the Cold War the book offers a new perspective on the histories of architecture technology and environmentalism one more fully entangled with the often competing dynamics of geopolitical and geophysical pressures
