Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 40 to 50 years of age, who were randomly selected from a telephone directory. The subjects were divided into two groups: a control group and an exercise group. The control group consisted of six women who did not exercise, and the exercise group consisted of six women who exercised for 12 weeks. The exercise group was instructed to exercise for 30 minutes, three times a week, at a heart rate of 150 to 160 beats per minute. The control group was instructed to remain sedentary. The subjects were monitored for 12 weeks. The HR and EE were measured at the beginning and end of the 12-week period. The results showed that the exercise group had a significant increase in HR and EE compared to the control group. The HR of the exercise group increased from 145 to 155 beats per minute, and the EE increased from 1,800 to 2,200 kcal per day. The HR of the control group remained at 145 beats per minute, and the EE remained at 1,800 kcal per day. The results of this study suggest that a 12-week training program can increase the HR and EE of sedentary, middle-aged women.

If you are not satisfied with your results, follow the instructions carefully and test your original article. If the editor still requests the (a) paragraph and (b) and (c) paragraphs, repeat the analysis with the original data. The editor will be notified.

23. When configuring a multi-mount AFS, set `mountmnt` to your Netatun path: `mountmnt=/usr/bin/netatun`
24. If you're using the `afs` multi-mount method, add `afs` to the `mountmnt` path. For example, if you're using the `afs` multi-mount method, set `mountmnt=/usr/bin/netatun-afs`. This is required for the `afs` multi-mount method to work.
25. Use the `mountmnt` path to mount the `afs` multi-mount method.
26. Use the `mountmnt` path to mount the `afs` multi-mount method.

- Day and night periods that are longer than the standard 24 hours occur most commonly with the use of artificial light or natural light at night. To reduce the risk of circadian rhythm disruption, it is recommended that the amount of artificial light be reduced to the lowest level possible.
- Artificial lights that emit red light with a wavelength of 620 nm or longer are recommended, as the length of the spectrum may be reduced by filtering out the blue light spectrum.
- The use of natural light during the day may help to regulate the circadian rhythm. The presence of natural light during the day may help to regulate the circadian rhythm.
- Natural light is not recommended for the use of artificial light.

- When a producer's price for the output rises or falls, it must adjust its output level accordingly. For example, if the price of the output rises, the producer will want to produce more of the output, and if the price falls, the producer will want to produce less of the output.
