Isaksen,2013-06-29 One of the major findings in the 1992 IPCC report and the 1994 World Meteorological Organization s Ozone Assessment report was the identification of possible climatic effects over the last few decades resulting from anthropogenic ally induced changes in atmospheric ozone The initial quantitative estimates of their direct climatic effects indicate significant impacts though large uncertainties exist and studies using general circulation models are needed A point that needs to be addressed in particular is that atmospheric ozone differs from greenhouse gases in that it is formed and destroyed by chemical processes in the atmosphere due to interaction involving a large number of source gases e g H₂O NO CO₂ x NMHC N₂O CH₄ and the CFCs Therefore the indirect effect of climate chemistry 2 4 interaction involving atmospheric ozone is an important aspect for consideration in general circulation models During the last few years there have been several international workshops related to atmospheric ozone In 1987 a NATO workshop on atmospheric ozone was held in Lillehammer Norway More recently two workshops were organized to discuss the topic General Circulation Model Study of Climate Chemistry Interaction The first was held August 19 21 1992 in Oslo Norway and the second held May 26 27 1993 in Albany New York USA The two workshops were IAMAP activities under the Trace Constituent Working Group Science and Art of Mining ,1926 Journal of the Society of Chemical Industry ,1911 *Rate Coefficients in Astrochemistry* T.J. around the period that Swings and Rosenfeld were writing provoked much interest but even the most optimistic speculator could hardly have imagined developments which would occur during the next 50 years By 1987 about 70 varieties of molecule had been identified in the interstellar and circumstellar regions They range in complexity from simple diatomics such as H₂ and CO to such species as ethanol C₂H₅OH acetone CH₃CO and the largest interstellar molecule detected so far cyano penta acetylene HC₁₁N The study of these molecules in astronomy has developed enormously especially over the last 20 years and is now codified in the new subject of astrochemistry That such a variety of chemical species should exist in tenuous regions of the Galaxy is fascinating

Meetings of the British Association for the Advancement of Science British Association for the Advancement of Science. Meeting, 1929 Modelling Tropospheric Volcanic Aerosol Anja Schmidt, 2013-01-18 Anja Schmidt's thesis is a unique and comprehensive evaluation of the impacts of tropospheric volcanic aerosol on the atmosphere climate air quality and human health Using a state of the art global microphysics model the thesis describes and quantifies the impact of volcanic sulphur emissions on global aerosol clouds and the radiative forcing of climate The advanced model enables the first ever estimate of the impact of the emissions on aerosol microphysical properties such as particle number concentrations and sizes and therefore a considerably improved ability to quantify the climate and air quality effects There are several important discoveries in this thesis Firstly it is shown that continuously degassing volcanoes exert a major effect on global clouds and climate Secondly the impact of the 1783 Laki eruption in Iceland is re examined to show that this long lasting flood lava eruption would have had major effects on clouds and climate Thirdly by combining her research on volcanism atmospheric science and epidemiology she shows that a present day Laki like eruption would seriously affect European air quality and cause over 100000 premature deaths in the first year
