

## **STAAR Science Tutorial 02**

### **TEK 8.5D: Chemical Formulas**

**TEK 8.5D:** *Recognize that chemical formulas are used to identify substances and determine the number of atoms of each element in chemical formulas containing subscripts.*

#### **Chemical Formulas**

- A **chemical formula** is a description of the number and kind of atoms found in a single molecule of a substance, using the symbol for each element and a subscript number to state the number of atoms of the element to the left of the subscript.
- Scientists use chemical formulas such as NaCl instead of common names (table salt) or chemical names (sodium chloride) because it is shorter, more accurate, and universally understood.
- Examples of chemical formulas include H<sub>2</sub>O (water), CO<sub>2</sub> (carbon dioxide), HC<sub>2</sub>H<sub>3</sub>O<sub>2</sub> (vinegar), NaHCO<sub>3</sub> (baking soda), NH<sub>4</sub> (ammonia), and C<sub>6</sub>H<sub>12</sub>O<sub>6</sub> (glucose).

- If asked how many different elements are in a chemical formula, remember that each element symbol starts with a capital letter. But be careful to not count an element twice if repeated in the formula. In HC<sub>2</sub>H<sub>3</sub>O<sub>2</sub>, there are only three elements, carbon, hydrogen and oxygen, even though there are four capital letters. (The H symbol is repeated twice in the formula.)
