Composing Electronic Music Curtis Roads, 2015-06-17 Electronic music evokes new sensations feelings and thoughts in both composers and listeners Opening the door to an unlimited universe of sound it engages spatialization as an integral aspect of composition and focuses on sound transformation as a core structural strategy In this new domain pitch occurs as a flowing and ephemeral substance that can be bent modulated or dissolved into noise Similarly time occurs not merely as a fixed duration subdivided by ratios but as a plastic medium that can be generated modulated reversed warped scrambled and granulated Envelope and waveform undulations on all time scales interweave to generate form The power of algorithmic methods amplify the capabilities of music technology Taken together these constitute game changing possibilities This convergence of technical and aesthetic trends prompts the need for a new text focused on the opportunities of a sound oriented multiscale approach to composition of electronic music Sound oriented means a practice that takes place in the presence of sound Multiscale means an approach that takes into account the perceptual and physical reality of multiple interacting time scales each of which can be composed After more than a century of research and development now is an appropriate moment to step back and reevaluate all that has changed under the ground of artistic practice Composing Electronic Music outlines a new theory of composition based on the toolkit of electronic music techniques The theory consists of a framework of concepts and a vocabulary of terms describing musical materials their transformation and their organization Central to this discourse is the notion of narrative structure in composition how sounds are born interact transform and die It presents a guidebook a tour of facts history commentary opinions and pointers to interesting ideas and new possibilities to consider and explore

WDM Systems and Networks Neophytos Neo Antoniadis, Georgios Ellinas, Ioannis Roudas, 2011-12-07 Modeling Simulation Design and Engineering of WDM Systems and Networks provides readers with the basic skills concepts and design techniques used to begin design and engineering of optical communication systems and networks at various layers The latest semi analytical system simulation techniques are applied to optical WDM systems and

networks and a review of the various current areas of optical communications is presented. Simulation is mixed with experimental verification and engineering to present the industry as well as state of the art research. This contributed volume is divided into three parts accommodating different readers interested in various types of networks and applications. The first part of the book presents modeling approaches and simulation tools mainly for the physical layer including transmission effects, devices, subsystems and systems, whereas the second part features more engineering design issues for various types of optical systems including ULH access and in building systems. The third part of the book covers networking issues related to the design of provisioning and survivability algorithms for impairment aware and multi domain networks. Intended for professional scientists, company engineers and university researchers, the text demonstrates the effectiveness of computer aided design when it comes to network engineering and prototyping.

High Performance Embedded Computing Handbook
David R. Martinez, Robert A. Bond, M. Michael Vai, 2018-10-03

Over the past several decades, applications permeated by advances in digital signal processing have undergone unprecedented growth in capabilities. The editors and authors of *High Performance Embedded Computing Handbook: A Systems Perspective* have been significant contributors to this field, and the principles and techniques presented in the handbook are reinforced by examples drawn from their work. The chapters cover system components found in today's HPEC systems by addressing design trade-offs, implementation options and techniques of the trade, then solidifying the concepts with specific HPEC system examples. This approach provides a more valuable learning tool. Because readers learn about these subject areas through factual implementation cases drawn from the contributing authors' own experiences.

Discussions include:

- Key subsystems and components
- Computational characteristics of high performance embedded algorithms and applications
- Front end real time processor technologies such as analog to digital conversion
- Application specific integrated circuits
- Field programmable gate arrays and intellectual property based design
- Programmable HPEC systems technology including interconnection fabrics
- Parallel and distributed processing
- Performance metrics and software architecture and automatic code parallelization and optimization

Examples of complex HPEC systems representative of actual prototype developments. Application examples including radar, communications, electro optical and sonar applications. The handbook is organized around a canonical framework that helps readers navigate through the chapters and it concludes with a discussion of future trends in HPEC systems. The material is covered at a level suitable for practicing engineers and HPEC computational practitioners and is easily adaptable to their own implementation requirements.
