

Given this information,

- What functional form would you recommend for estimating Model I? Be sure to write out a specific equation.
- What functional form would you recommend for estimating Model II? Be sure to write out a specific equation.
- Would R^2 be a reasonable way to compare the overall fits of the two equations? Why or why not?

Note: In the following question, you may want to change the absolute size of the coefficients, depending on the size of your school, but remember to change the size of the standard errors proportionally.

- On your way to the cashier's office (to pay yet another dorm damage bill), you overhear U. R. Accepted (the Dean of Admissions) having a violent argument with I. M. Smart (the director of the Computer Center) about an equation that Smart built to understand the number of applications that the school received from high school seniors. In need of an outside opinion, they turn to you to help them evaluate the following regression results (standard errors in parentheses):

$$\hat{N}_t = 150 + 180A_t + 1.50 \ln T_t + 30.0P_t$$

(90) (1.50) (60.0)

$$R^2 = 0.50 \quad N = 22 \quad (\text{annual})$$

where: N_t = the number of high school seniors who apply for admission in year t

A_t = the number of people on the admission staff who visit high schools full time spreading information about the school in year t

T_t = dollars of tuition in year t

P_t = the percent of the faculty in year t that had PhDs in year t

How would you respond if they asked you to:

- Discuss the expected signs of the coefficients.
- Compare these expectations with the estimated coefficients by using the appropriate tests.
- Evaluate the possible econometric problems that could have caused any observed differences between the estimated coefficients and what you expected.
- Determine whether the semilog function for T makes theoretical sense.
- Make any suggestions you feel are appropriate for another run of the equation.

Answers:

- See Section 6.2.
 - See Section 6.2.
 - See Section 6.4.
 - Constant = β_1 .
 - Positive, since the expected sign of the coefficient of experience is positive and since the simple correlation coefficient between age and experience is positive. See Section 6.1.3.
- See Section 6.1. Note in particular that biased estimates can at times be closer to the true β than unbiased ones and that the solution to omitted variable bias is *not* to simply include every justifiable variable.

Laureates, sixth edition Roger W. Spencer, David A. Macpherson, 2014-11-28 Autobiographical accounts by Nobel laureates reflect the richness and diversity of contemporary economic thought and offer insights into the creative process. Lives of the Laureates offers readers an informal history of modern economic thought as told through autobiographical essays by twenty three Nobel Prize laureates in Economics. The essays not only provide unique insights into major economic ideas of our time but also shed light on the processes of intellectual discovery and creativity. The accounts are accessible and engaging, achieving clarity without sacrificing inherently difficult content. This sixth edition adds four recent Nobelists to its pages: Eric Maskin who illustrates his explanation of mechanism design with an example involving a mother, a cake, and two children; Joseph Stiglitz who recounts his field's ideological wars linked to policy disputes; Paul Krugman who describes the insights he gained from studying the model of the Capitol Hill Babysitting Coop and the recession it suffered when more people wanted to accumulate babysitting coupons than redeem them; and Peter Diamond who maps his development from student to teacher to policy analyst. Lives of the Laureates grows out of a continuing lecture series at Trinity University in San Antonio which invites Nobelists from American universities to describe their evolution as economists in personal as well as technical terms. These lectures demonstrate the richness and diversity of contemporary economic thought. The reader will find that paths cross in unexpected ways that disparate thinkers were often influenced by the same teachers and that luck as well as hard
