Purchase of this book includes free trial access to www.millionbooks.com where you can read more than a million books for free. This is an OCR edition with typos. Excerpt from book: Is it the amount of water in the trap or the depth of seal that offers the most resistance to siphonage? It is the amount of water. Is it the amount of water in the trap or the depth of seal that offers the most resistance to the entrance of sewer gas? The depth of seal offers the greatest resistance. What is the effect of the pressure of sewer gas on the trap seal? It saturates the water in the trap with sewer gas which is finally thrown off into the room. What are the two principal types of traps on which all other traps are based? The S trap and the drum trap. What are the comparative advantages of the S and drum traps? The S trap, being self-scouring, is cleaner than the drum trap but when unvented the drum trap is much less liable to siphonage. The drum trap may often be used to better advantage under the floor than the S trap. What are the relative advantages of different connections for drum traps? In the illustration on page 8 we show nine different methods for this work. No 6 represents probably the most common method. The chief objection to this method is the fact that if the gasket does not make tight direct communication will exist. This will be the case also when the trap screw is taken out for cleaning. The chief advantage of No 7 is that protection against the entrance of sewer gas is guaranteed even when the trap screw is removed. An objection, however, is that the outlet from the trap is liable to fill up. No 8 overcomes the objectionable features of Nos 6 and 7 but the pipe dipping down into the seal is an objection as it presents additional opportunity for the collection of grease etc. The objection to a vent through the cleanout cover as shown in No 9 is that whenever the trap is cleaned the vent pipe must be twisted.
