Experience, Theory and Practice** Stefano

Aversa, Leonardo Cascini, Luciano Picarelli, Claudio Scavia, 2018-04-17 **Landslides and Engineered Slopes Experience Theory and Practice** contains the invited lectures and all papers presented at the 12th International Symposium on Landslides Naples Italy 12-19 June 2016. The book aims to emphasize the relationship between landslides and other natural hazards. Hence three of the main sessions focus on Volcanic induced landslides, Earthquake induced landslides and Weather induced landslides respectively, while the fourth main session deals with Human induced landslides. Some papers presented in a special session devoted to Subareal and submarine landslide processes and hazard and in a Young Session complete the books. **Landslides and Engineered Slopes Experience Theory and Practice** underlines the importance of the classic approach of modern science which moves from experience to theory as the basic instrument to study landslides. Experience is the key to understand the natural phenomena focusing on all the factors that play a major role. Theory is the instrument to manage the data provided by experience following a mathematical approach; this allows not only to clarify the nature and the deep causes of phenomena but mostly to predict future and if required manage similar events. Practical benefits from the results of theory to protect people and man-made works. **Landslides and Engineered Slopes Experience Theory and Practice** is useful to scientists and practitioners working in the areas of rock and soil mechanics, geotechnical engineering, engineering geology and geology.

On the dissolution, precipitation and transport processes in sulphatic swelling rocks Konstantinos Serafeimidis, 2014-10-22. Sulphatic claystones are among the most problematic rocks in tunnelling due to their distinctive swelling properties. They are known to have caused severe damage for example to numerous tunnels excavated in the Gypsum Keuper formation. The repairs were extremely costly and time consuming and often provided only a temporary solution. The setbacks experienced in tunnelling through Gypsum Keuper may be attributed among other things to our limited knowledge of the macroscopic principles governing the swelling process and the underlying microscopic mechanisms. The issues in question have formed the focal point of long standing research in the Chair of Underground Construction at ETH Zurich. A series of theoretical and experimental research projects are being conducted to investigate the interactions between chemical reactions, transport processes and the observed macroscopic behaviour. The objective of the investigations is to improve our understanding of swelling processes in order to yield a scientifically established basis for design. This work has achieved important progress towards this objective. It has systematically and comprehensively analysed the thermodynamics and the kinetics of the chemical reactions involved in the swelling process as well as their interplay with advective and diffusive ion transport. The topic is of great value in terms of further investigation in this area.
