Multi-Level Simulation for VLSI Design D.D. Hill, D.R. Coelho, 2012-12-06 AND BACKGROUND 1.1 CAD

Specification and Simulation Computer Aided Design CAD is today a widely used expression referring to the study of ways in which computers can be used to expedite the design process This can include the design of physical systems architectural environments manufacturing processes and many other areas This book concentrates on one area of CAD the design of computer systems Within this area it focusses on just two aspects of computer design the specification and the simulation of digital systems VLSI design requires support in many other CAD areas including automatic layout IC fabrication analysis test generation and others The problem of specification is unique however in that it is often the first one encountered in large chip designs and one that is unlikely ever to be completely automated This is true because until a design's objectives are specified in a machine readable form there is no way for other CAD tools to verify that the target system meets them And unless the specifications can be simulated it is unlikely that designers will have confidence in them since specifications are potentially erroneous themselves In this context the term target system refers to the hardware and or software that will ultimately be fabricated On the other hand since the functionality of a VLSI chip is ultimately determined by its layout geometry one might question the need for CAD tools that work with areas other than layout
