*Advances in Cryogenic Engineering* K. D. Timmerhaus, 2013-03-08 More than sixty years have elapsed since Linde first liquefied air on a commercial scale and prepared the way for separating of other gaseous mixtures His work however was not of an isolated nature It was conceived eighteen years after air had for the first time been liquefied in the laboratory by Pictet in Geneva and Caillete in Paris Linde's liquefaction of air was followed by Dewar's work on hydrogen liquefaction in London and by the setting up at Leiden of Kamerlingh Onnes's famous low temperature laboratory These advances in low temperature or cryogenic technology have resulted in the establishment of a completely new and thriving industry Cryogenic engineering is concerned with developing and improving low temperature processes techniques and equipment determining the physical properties of structural and related materials used in producing maintaining and using low temperatures and the practical application of low temperature techniques and processes These low temperatures are below those usually encountered in refrigerating engineering It is rather difficult to assign a definite temperature which serves to divide refrigerating engineering from cryogenic engineering A temperature below  $-150^{\circ}\text{C}$  however is generally associated with cryogenic engineering
