Systems Riccardo Manzini, Alberto Regattieri, Hoang Pham, Emilio Ferrari, 2009-11-09 New global and extended markets are forcing companies to process and manage increasingly differentiated products with shorter life cycles low volumes and reduced customer delivery times In today's global marketplace production systems need to be able to deliver products on time maintain market credibility and introduce new products and services faster than competitors As a result a new production paradigm of a production system has been developed and a supporting management decision making approach simultaneously incorporating design management and control of the production system is necessary so that this challenge can be effectively and efficiency met Maintenance Engineering and its Applications in Production Systems meets this need by

introducing an original and integrated idea of maintenance maintenance for productivity The volume starts with the introduction and discussion of a new conceptual framework based on productivity quality and safety supported by maintenance Subsequent chapters illustrate the most relevant models and methods to plan organise implement and control the whole maintenance process reliability evaluation models and prediction maintenance strategies and policies spare parts management computer maintenance management software CMMS and total productive maintenance TPM etc Several examples of problems supported by solutions and real applications to help and test the reader s comprehension are included Maintenance Engineering and its Applications in Production Systems will certainly be valuable to engineering students doctoral and post doctoral students and also to maintenance practitioners as well as managers of industrial and service companies

Condition-Based Maintenance and Residual Life Prediction Chandan Deep Singh,Davinder Singh,Kanwal Jit

Singh,Harleen Kaur,2025-03-10 Condition Based Maintenance and Residual Life Prediction is essential for those looking to effectively implement condition based maintenance strategies and enhance fault detection through a comprehensive understanding of vibration data analysis and residual life prediction addressing key challenges in the field Issues related to condition based maintenance include its high initial cost new techniques that can be difficult to implement due to resistance older equipment that can be difficult to retrofit with sensors and monitoring equipment and difficult to access equipment during production that is difficult to spot measure Keeping the above issues in mind a general handbook for condition based maintenance and residual life prediction is required to carry out in fault detection Condition Based Maintenance and Residual Life Prediction aims to develop analyze and model condition based maintenance and residual life prediction through vibration data The analysis of vibration responses will aid in developing a fault detection system The sources of vibration may be due to the presence of different types of defects such as cracks in the shaft a bent shaft or misalignment of shafts This will give designers a diagnostic tool for predicting the trends of vibration conditions leading to early fault detection The devised tool will be capable of quantifying the amplitude of vibration based on the severity of defects With the features available in

the devised diagnostic tool the proposed model can be used for design predictive maintenance and condition based maintenance

Verification and Validation of Complex Systems: Human Factors Issues John A. Wise, V. David Hopkin, Paul Stager, 2013-06-29 Despite its increasing importance the verification and validation of the human machine interface is perhaps the most overlooked aspect of system development Although much has been written about the design and development process very little organized information is available on how to verify and validate highly complex and highly coupled dynamic systems Inability to evaluate such systems adequately may become the limiting factor in our ability to employ systems that our technology and knowledge allow us to design This volume based on a NATO Advanced Science Institute held in 1992 is designed to provide guidance for the verification and validation of all highly complex and coupled systems Air traffic control is used as an example to ensure that the theory is described in terms that will allow its implementation but the results can be applied to all complex and coupled systems The volume presents the knowledge and theory in a format that will allow readers from a wide variety of backgrounds to apply it to the systems for which they are responsible The emphasis is on domains where significant advances have been made in the methods of identifying potential problems and in new testing methods and tools Also emphasized are techniques to identify the assumptions on which a system is built and to spot their weaknesses
