

# Characteristics of Ocean Waves

Most waves are caused by wind. As a wave moves through water, the surface of the water rises and falls. The highest part of a wave is referred to as the crest; the lowest part is called the trough. The wave height is the difference in level between the crest and the trough. The wavelength is the distance between two successive crests or troughs.

The time required for two successive crests or troughs to pass a certain point is referred to as the wave period. Wave speed can be calculated using the following relationship.

$$\text{wave speed} = \frac{\text{wavelength}}{\text{wave period}}$$

When waves move into shallow water, the troughs begin to drag along the bottom and slow down, while the crests continue at their normal speed. As a result, the front of the wave becomes steeper than the back of the wave. Eventually the crest topples over and the wave is said to break. Waves break in water that has a depth equal to approximately one-half the wavelength or about 1.3 times the wave height.
