Glycopeptides and Glycoproteins Valentin Wittmann, Samuel J. Danishefsky, 2007-02-13

In the last 50 years molecular biology was dominated by the exploration of proteins and nucleic acids. Beside their role in energy metabolism, oligosaccharides which represent the third class of biomacromolecules have received less attention. Today it is well established that oligosaccharides are involved in many important biological regulation and recognition processes from protein folding to cell-cell communication. Glycosylation of proteins is the most complex form of co and posttranslational modification. The determination of structure-function relationships however remains difficult due to the microheterogeneity of glycoproteins that exist in many different glycoforms. Thus chemical synthesis of glycoproteins and glycopeptides with defined glycan structures plays a pivotal role for the detailed determination of the role of protein glycosylation. This topic is covered by the first two chapters of this book dealing with the chemical and enzymatic synthesis of glycopeptides and glycoproteins. The third chapter describes the construction of glycopeptide and glycoprotein mimetics containing non-natural structural elements. These so-called neoglycopeptides and neoglycoproteins respectively can provide insight on the importance of distinct structural elements on biological activity and may have improved properties such as an increased stability. The application of synthetic glycopeptides in many cases at the clinical level as vaccines for both cancer and HIV is the subject of the fourth chapter. Glycopeptide antibiotics are glycosylated secondary metabolites of bacteria and fungi that are synthesized by non-ribosomal peptide synthetases. Some of them serve as antibiotics of last resort in the treatment of nosocomial infections with enterococci and methicillin-resistant *Staphylococcus aureus* MRSA strains. Their structure, biosynthesis and mode of action are summarized in the fifth chapter. The last chapter covers current methods for the determination of high-resolution structures of glycopeptides and glycoproteins mainly based on NMR spectroscopy. X

Denlinger, J. Giebultowicz, D.S. Saunders, 2001-06-19 Now that many of the clock

genes have been identified it is possible to track daily patterns of clock related mRNAs and proteins to link the entraining light cycles with molecular oscillations within the cell Insect experiments have led the way in demonstrating that the concept of a master clock can no longer be used to explain the temporal organization within an animal Insects have a multitude of cellular clocks that can function independently and retain their function under organ culture conditions and they thus offer a premier system for studying how the hierarchical organization of clocks results in the overall temporal organization of the animal Photoperiodism and its most obvious manifestation diapause does not yet have the molecular underpinning that has been established for circadian rhythms but recent studies are beginning to identify genes that appear to be involved in the regulation of diapause
